Abstract. In this paper, we introduce a hybrid subgradient method for finding an element common to both the solution set of a class of pseudomonotone equilibrium problems, and the set of fixed points of a finite family of $\kappa$-strictly pronouncef mappings in a real Hilbert space. We establish some weak and strong convergence theorems of the sequences generated by our iterative method under some suitable conditions. These convergence theorems are investigated without the Lipschitz condition for bifunctions. Our results complement many known recent results in the literature.

1. Introduction

Let $H$ be a real Hilbert space in which the inner product and norm are denoted by $\langle \cdot, \cdot \rangle$ and $\| \cdot \|$, respectively. Let $C$ be a nonempty closed convex subset of $H$. Let $T : C \to C$ be a mapping. A point $x \in C$ is called a fixed point of $T$ if $Tx = x$ and we denote the set of fixed points of $T$ by $F(T)$. Recall that a mapping $T : C \to C$ is said to be nonexpansive if

$$\|Tx - Ty\| \leq \|x - y\|, \text{ for all } x, y \in C,$$

and it is said to be quasi-nonexpansive if $F(T) \neq \emptyset$ and

$$\|Tx - Ty\| \leq \|x - y\|, \text{ for all } x \in C, \text{ and } y \in F(T).$$

Key words and phrases: pseudomonotone equilibrium problem, $\kappa$-strictly prononcedsfiding mapping, nonsmoothing type mapping, hybrid subgradient method, fixed point.

This work was supported by Faculty of Science and Technology, Rajamangala University of Technology Thanyaburi (RMUTT) Thailand.
A mapping \( T : C \to C \) is said to be a strict pseudocontraction if there exists a constant \( k \in [0, 1) \) such that
\[
\|Tx - Ty\|^2 \leq \|x - y\|^2 + k\|(I - T)x - (I - T)y\|^2, \quad \forall x, y \in C,
\]
where \( I \) is the identity mapping on \( H \). If \( k = 0 \), then \( T \) is nonexpansive on \( C \).

In 2008, Kohsaka and Takahashi [15] defined a mapping \( T \) in a in Hilbert spaces \( H \) to be nonspreading if
\[
2\|Tx - Ty\|^2 \leq \|Tx - y\|^2 + \|Ty - x\|^2, \quad \text{for all } x, y \in C.
\]
Following the terminology of Browder-Petryshyn [10], Osilike and Isiogugu [17] called a mapping \( T \) of \( C \) into itself \( \kappa \)-strictly pseudononspraying if there exists \( \kappa \in [0, 1) \) such that
\[
\|Tx - Ty\|^2 \leq \|x - y\|^2 + 2\langle x - Tx, y - Ty \rangle + \kappa \|x - Tx - (y - Ty)\|^2, \quad \text{for all } x, y \in C.
\]
Clearly, every nonspreading mapping is \( \kappa \)-strictly pseudononspraying but the converse is not true; see [17]. We note that the class of strict pseudocontraction mappings and the class of \( \kappa \)-strictly pseudononspraying mappings are independent.

In 2010, Kurokawa and Takahashi [16] obtained a weak mean ergodic theorem of Baillon’s type [7] for nonspreading mappings in Hilbert spaces. Furthermore, using the idea of mean convergence in Hilbert spaces, they also proved a strong convergence theorem of Halpern’s type [12] for this class of mappings. After that, in 2011, Osilike and Isiogugu [17] introduced the concept of \( \kappa \)-strictly pseudononspraying mappings and they proved a weak mean convergence theorem of Baillon’s type similar to [16]. They further proved a strong convergence theorem using the idea of mean convergence. This theorem extended and improved the main theorems of [16] and gave an affirmative answer to an open problem posed by Kurokawa and Takahashi [16] for the case when the mapping \( T \) is averaged. In 2013 Kangtun-yakarn [14] proposed a new technique, using the projection method, for \( \kappa \)-strictly pseudononspraying mappings. He obtained a strong convergence theorem for finding the common element of the set of solutions of a variational inequality, and the set of fixed points of \( \kappa \)-strictly pseudononspraying mappings in a real Hilbert space.

On the other hand, let \( F \) be a bifunction of \( C \times C \) into \( \mathbb{R} \), where \( \mathbb{R} \) is the set of real numbers. The equilibrium problem for \( F : C \times C \to \mathbb{R} \) is to find \( x \in C \) such that
\[
F(x, y) \geq 0 \quad \text{for all } y \in C.
\]
(1.1)

The set of solutions of (1.1) is denoted by \( EP(F, C) \). It is well known that there are several problems, such as complementarity problems, minimax problems, the Nash equilibrium problem in noncooperative games, fixed point problems, optimization problems, that can be written in the form of an \( EP \). In other words, the \( EP \) is a unifying model for several problems arising in physics, engineering, science, optimization, economics, etc.; see [6, 8, 11] and the references therein.
In recent years the problem of finding an element common to the set of solutions of an equilibrium problem, and the set of fixed points of nonlinear mappings, has become a fascinating subject, and various methods have been developed by many authors for solving this problem (see [1, 4, 5, 20]). Most of all the existing algorithms for this problem are based on applying the proximal point method to the equilibrium problem $EP(F,C)$, and using a Mann’s iteration to the fixed point problems of nonexpansive mappings. The convergence analysis has been considered when the bifunction $F$ is monotone. This is because the proximal point method is not valid when the underlying operator $F$ is pseudomonotone.

Recently, Anh [2] introduced a new hybrid extragradient iteration method for finding a element common to the set of fixed points of a nonexpansive mapping and the set of solutions of equilibrium problems for a pseudomonotone bifunctions. In this algorithm the equilibrium bifunction is not required to satisfy any monotonicity property, but it must satisfy a Lipschitz-type continuous bifunction i.e. there are two Lipschitz constants $c_1 > 0$ and $c_2 > 0$ such that

$$f(x, y) + f(y, z) \geq f(x, z) - c_1\|x - y\|^2 - c_2\|y - z\|^2, \forall x, y, z \in C.$$  

(1.2)

They obtained strongly convergent theorems for the sequences generated by these processes in a real Hilbert space.

Anh and Muu [3] reiterated that the Lipschitz-type condition (1.2) is not in general satisfied, and if it is, that finding the constants $c_1$ and $c_2$ is not easy. They further observed that solving strongly convex programs is also difficult except in special cases when $C$ has a simple structure. They introduced and studied a new algorithm, which is called a hybrid subgradient algorithm for finding a common point in the set of fixed points of nonexpansive mappings and the solution set of a class of pseudomonotone equilibrium problems in a real Hilbert space. The proposed algorithm is a combination of the well-known Mann’s iterative scheme for fixed point and the projection method for equilibrium problems. Furthermore, the proposed algorithm uses only one projection and does not require any Lipschitz condition for the bifunctions. To be more precise, they proposed the following iterative method:

$$\begin{align*}
  x_0 & \in C, \\
  w_n & \in \partial_{\epsilon_n} F(x_n, \cdot) x_n, \\
  u_n & = PC(x_n - \gamma_n w_n), \quad \gamma_n = \max\{\sigma_n, \|w_n\|\}, \\
  x_{n+1} & = \alpha_n x_n + (1 - \alpha_n) Tu_n, \quad \text{for each } n = 1, 2, 3, \ldots,
\end{align*}$$

(1.3)

where $\partial_{\epsilon} F(x, \cdot)(x)$ stands for $\epsilon$-subdifferential of the convex function $F(x, \cdot)$ at $x$ and $\{\epsilon_n\}$, $\{\gamma_n\}$, $\{\beta_n\}$, $\{\sigma_n\}$, and $\{\alpha_n\}$ were chosen appropriately. Under certain conditions, they prove that $\{x_n\}$ converges strongly to a common point in the set of a class of pseudomonotone equilibrium problems and the set of fixed points of nonexpansive mapping. Using the idea of Anh and Muu [3], Thailert et al. [21] proposed a new algorithm for finding a common point in the solution set of a class of pseudomonotone equilibrium problems and the set of common fixed points of a
family of strict pseudocontraction mappings in a real Hilbert space. Then Thailert et al. [22] introduced new general iterative methods for finding a common element in the solution set of pseudomonotone equilibrium problems and the set of fixed points of nonexpansive mappings which is a solution of a certain optimization problem related to a strongly positive linear operator. Under suitable control conditions, They proved the strong convergence theorems of such iterative schemes in a real Hilbert space.

In this paper, motivated by Anh and Muu [3], Kangtunyakarn [14], and other research going on in this direction, we proposed a hybrid subgradient method for the pseudomonotone equilibrium problem and the finite family of $\kappa$-strictly pseudononspreading mapping in a real Hilbert space. The weak and strong convergence of the proposed methods is investigated under certain assumptions. Our results improve and extend many recent results in the literature.

2. Preliminaries

Let $H$ be a real Hilbert space with inner product $\langle \cdot, \cdot \rangle$ and norm $\| \cdot \|$, respectively. It is well-known that for all $x, y, z \in H$ and $\alpha, \beta, \gamma \in [0, 1]$, with $\alpha + \beta + \gamma = 1$ there holds
\[
\| x - y \|^2 = \| x \|^2 - \| y \|^2 - 2 \langle x - y, y \rangle,
\]
and
\[
\| \alpha x + \beta y + \gamma z \|^2 = \alpha \| x \|^2 + \beta \| y \|^2 + \gamma \| z \|^2 - \alpha \beta \| x - y \|^2 - \beta \gamma \| y - z \|^2.
\]

Let $C$ be a nonempty closed convex subset of $H$. Then, for any $x \in H$, there exists a unique nearest point of $C$, denoted by $P_Cx$, such that $\| x - P_Cx \| \leq \| x - y \|$ for all $y \in C$. Such a $P_C$ is called the metric projection from $H$ into $C$. We know that $P_C$ is nonexpansive. It is also known that, $P_Cx \in C$ and
\[
\langle x - P_Cx, P_Cx - z \rangle \geq 0, \quad \text{for all } x \in H \text{ and } z \in C.
\]
It is easy to see that (2.3) equivalent to
\[
\| x - z \|^2 \geq \| x - P_Cx \|^2 + \| z - P_Cx \|^2, \quad \text{for all } x \in H \text{ and } z \in C.
\]

**Lemma 2.1.** ([19]) Let $H$ be a real Hilbert space, let $C$ be a nonempty closed convex subset of $H$ and let $A$ be a mapping of $C$ into $H$. Let $u \in C$. Then for $\lambda > 0$,
\[
u \in VI(C, A) \iff u = P_C(\lambda I - \lambda A)u,
\]
where $P_C$ is the metric projection of $H$ onto $C$.

Recall that a bifunction $F : C \times C \to \mathbb{R}$ is said to be
(i) \(\eta\)-strongly monotone if there exists a number \(\eta > 0\) such that
\[
F(x, y) + F(y, x) \leq -\eta \|x - y\|^2, \quad \text{for all } x, y \in C,
\]
(ii) monotone on \(C\) if
\[
F(x, y) + F(y, x) \leq 0, \quad \text{for all } x, y \in C,
\]
(iii) pseudomonotone on \(C\) with respect to \(x \in C\) if
\[
F(x, y) \geq 0 \quad \text{implies} \quad F(y, x) \leq 0, \quad \text{for all } y \in C.
\]

It is clear that (i) \(\Rightarrow\) (ii) \(\Rightarrow\) (iii), for every \(x \in C\). Moreover, \(F\) is said to be pseudomonotone on \(C\) with respect to \(A \subseteq C\), if it is pseudomonotone on \(C\) with respect to every \(x \in A\). When \(A \equiv C\), \(F\) is called pseudomonotone on \(C\).

The following example, taken from [18], shows that a bifunction may not be pseudomonotone on \(C\), but yet is pseudomonotone on \(C\) with respect to the solution set of the equilibrium problem defined by \(F\) and \(C\):
\[
F(x, y) := 2y|x| (y - x) + xy|y - x|, \quad \text{for all } x, y \in \mathbb{R}, \quad C := [-1, 1].
\]

Clearly, \(EP(F) = \{0\}\). Since \(F(y, 0) = 0\) for every \(y \in C\), this bifunction is pseudomonotone on \(C\) with respect to the solution \(x^* = 0\), However, \(F\) is not pseudomonotone on \(C\). In fact, both \(F(-0.5, 0.5) = 0.25 > 0\) and \(F(0.5, -0.5) = 0.25 > 0\).

For solving the equilibrium problem (1.1), let us assume that \(\Delta\) is an open convex set containing \(C\) and the bifunction \(F : \Delta \times \Delta \rightarrow \mathbb{R}\) satisfies the following assumptions:

(A1) \(F(x, x) = 0\) for all \(x \in C\) and \(F(x, \cdot)\) is convex and lower semicontinuous on \(C\);

(A2) for each \(y \in C\), \(F(\cdot, y)\) is weakly upper semicontinuous on the open set \(\Delta\);

(A3) \(F\) is pseudomonotone on \(C\) with respect to \(EP(F, C)\) and satisfies the strict paramonotonicity property, i.e., \(F(y, x) = 0\) for \(x \in EP(F, C)\) and \(y \in C\) implies \(y \in EP(F, C)\);

(A4) if \(\{x_n\} \subseteq C\) is bounded and \(\epsilon_n \rightarrow 0\) as \(n \rightarrow \infty\), then the sequence \(\{w_n\}\) with \(w_n \in \partial \epsilon F(x_n, \cdot) x_n\) is bounded, where \(\partial \epsilon F(x, \cdot) x\) stands for the \(\epsilon\)-subdifferential of the convex function \(F(x, \cdot)\) at \(x\).

The following idea of the \(\epsilon\)-subdifferential of convex functions can be found in the work of Bronsted and Rockafellar [9] but the theory of \(\epsilon\)-subdifferential calculus was given by Hiriart-Urruty [13].

**Definition 2.2.** Consider a proper convex function \(\phi : C \rightarrow \mathbb{R}\). For a given \(\epsilon > 0\), the \(\epsilon\)-subdifferential of \(\phi\) at \(x_0 \in Dom \phi\) is given by
\[
\partial \epsilon \phi(x_0) = \{x \in C : \phi(y) - \phi(x_0) \geq \langle x, y - x_0 \rangle - \epsilon, \quad \forall y \in C\}.
\]
Remark 2.3. It is known that if the function $\phi$ is proper lower semicontinuous convex, then for every $x \in \text{Dom} \phi$, the $\epsilon$-subdifferential $\partial_\epsilon \phi(x)$ is a nonempty closed convex set (see [13]).

Next, throughout this paper, weak and strong convergence of a sequence $\{x_n\}$ in $H$ to $x$ are denoted by $x_n \rightharpoonup x$ and $x_n \rightarrow x$, respectively. In order to prove our main results, we need the following lemmas.

Lemma 2.4.([17]) Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$, and let $T : C \rightarrow C$ be a $\kappa$-strictly pseudononspreading mapping. If $F(T) \neq \emptyset$, then it is closed and convex.

Remark 2.5. If $T : C \rightarrow C$ is a $\kappa$-strictly pseudononspreading mapping with $F(T) \neq \emptyset$, then from Lemma 2.8 in [14] and Lemma 2.1, we have $F(T) = \text{VI}(C, (I - T)) = F(P_C(I - \lambda(I - T)))$, for all $\lambda > 0$.

Lemma 2.6. Let $H$ be a real Hilbert space and $C$ be a nonempty closed convex subset of $H$. For every $i = 1, 2, \ldots, N$, let $T_i : C \rightarrow C$ be a finite family of $\kappa_i$-strictly pseudononspreading mappings with $\bigcap_{i=1}^N F(T_i) \neq \emptyset$. Let $\{a_1, a_2, \ldots, a_n\} \subset (0, 1)$ with $\sum_{i=1}^N a_i = 1$, let $\bar{\kappa} = \max\{\kappa_1, \kappa_2, \ldots, \kappa_N\}$ and let $\lambda \in (0, 1 - \bar{\kappa})$. Then

(i) $\bigcap_{i=1}^N F(T_i) = F(\sum_{i=1}^N a_i P_C(I - \lambda(I - T_i)))$.

(ii) $\|\sum_{i=1}^N a_i P_C(I - \lambda(I - T_i)) x - y\|^2 \leq \|x - y\|^2$, for all $x \in C$ and $y \in \bigcap_{i=1}^N F(T_i)$, i.e. $\sum_{i=1}^N a_i P_C(I - \lambda(I - T_i))$ is quasi-nonexpansive.

Proof. (i) It easy to see that $\bigcap_{i=1}^N F(T_i) \subseteq F(\sum_{i=1}^N a_i P_C(I - \lambda(I - T_i)))$. Let $x \in F(\sum_{i=1}^N a_i P_C(I - \lambda(I - T_i)))$ and let $x^* \in \bigcap_{i=1}^N F(T_i)$, let $\|P_C(I - \lambda(I - T_i)) x - x^*\|^2 \leq \|x - x^* - \lambda(I - T_i)\|^2$

\begin{equation}
= \|x - x^*\|^2 - 2\lambda \langle x - x^*, (I - T_i)x\rangle + \lambda^2 \|T_i x - x^*\|^2.
\end{equation}

(ii) Put $A_i = I - T_i$, for all $i = 1, 2, \ldots, N$, we have $T_i = I - A_i$ and

\begin{equation}
\|T_i x - T_i x^*\|^2 = \|(I - A_i)x - (I - A_i)x^*\|^2
\end{equation}

\begin{align*}
&= \|(x - x^*) - A_i x\|^2 \\
&= \|x - x^*\|^2 - 2\langle x - x^*, A_i x\rangle + \|A_i x\|^2 \\
&\leq \|x - x^*\|^2 + \kappa_i \|(I - T_i)x - (I - T_i)x^*\|^2 + 2\langle x - T_i x, x^* - T_i x^*\rangle \\
&= \|x - x^*\|^2 + \kappa_i \|(I - T_i)x\|^2,
\end{align*}

which implies that

\[(1 - \kappa_i)\|(I - T_i)x\|^2 \leq 2\langle x - x^*, A_i x\rangle, \text{ for all } i = 1, 2, 3, \ldots, N\]
From (2.5) and (2.6), we have
\[ \| P_C(I - \lambda(I - T_i))x - x^* \|^2 \leq \| x - x^* \|^2 - 2\lambda \langle x - x^*, (I - T_i)x \rangle \]
\[ + \lambda^2 \|(I - T_i)x\|^2 \]
\[ \leq \| x - x^* \|^2 - \lambda(1 - \kappa_i)\|(I - T_i)x\|^2 \]
\[ + \lambda^2 \|(I - T_i)x\|^2 \]
\[ = \| x - x^* \|^2 - \lambda[(1 - \kappa_i) - \lambda]\|(I - T_i)x\|^2 \]
\[ \leq \| x - x^* \|^2, \]
(2.7)
for all \( i = 1, 2, 3, \ldots, N \).
From the definition of \( x \) and (2.7), we have
\[ \| x - x^* \|^2 = \| \sum_{i=1}^{N} a_i P_C(I - \lambda(I - T_i))x - x^* \|^2 \]
\[ = a_1 \| P_C(I - \lambda(I - T_1))x - x^* \|^2 + a_2 \| P_C(I - \lambda(I - T_2))x - x^* \|^2 + \cdots \]
\[ + a_N \| P_C(I - \lambda(I - T_N))x - x^* \|^2 - a_1a_2 \| P_C(I - \lambda(I - T_1))x - P_C(I - \lambda(I - T_2))x \|^2 \]
\[ - P_C(I - \lambda(I - T_2))x - \cdots - a_{N-1} \| P_C(I - \lambda(I - T_{N-1}))x - P_C(I - \lambda(I - T_N))x \|^2 \]
\[ \leq \| x - x^* \|^2 - a_1a_2 \| P_C(I - \lambda(I - T_1))x - P_C(I - \lambda(I - T_2))x \|^2 \]
\[ - a_2a_3 \| P_C(I - \lambda(I - T_2))x - P_C(I - \lambda(I - T_3))x \|^2 - \cdots \]
\[ - a_{N-1}a_N \| P_C(I - \lambda(I - T_{N-1}))x - P_C(I - \lambda(I - T_N))x \|^2. \]
This implies that
\[ P_C(I - \lambda(I - T_1))x = P_C(I - \lambda(I - T_2))x = \cdots = P_C(I - \lambda(I - T_N))x. \]
Since \( x \in F(\Sigma_{i=1}^{N} a_i P_C(I - \lambda(I - T_i))) \), we get that \( x = P_C(I - \lambda(I - T_i))x \), for all \( i = 1, 2, 3, \ldots, N \). From Remark 2.5, we have \( x \in F(T_i) \) for all \( i = 1, 2, 3, \ldots, N \). That is \( x \in \bigcap_{i=1}^{N} F(T_i) \). Hence \( F(\Sigma_{i=1}^{N} a_i P_C(I - \lambda(I - T_i))) \subseteq \bigcap_{i=1}^{N} F(T_i) \).
(ii) Let \( x \in C \) and \( y \in \bigcap_{i=1}^{N} F(T_i) = F(\Sigma_{i=1}^{N} a_i P_C(I - \lambda(I - T_i))) \).
As the same argument as in (i), we can show that
\[ (2.8) \quad \| P_C(I - \lambda(I - T_i))x - y \|^2 \leq \| x - y \|^2, \]
for all \( i = 1, 2, 3, \ldots, N \). Thus
\[ \| \sum_{i=1}^{N} a_i P_C(I - \lambda(I - T_i))x - y \|^2 \leq a_1 \| P_C(I - \lambda(I - T_1))x - y \|^2 \]
\[ + a_2 \| P_C(I - \lambda(I - T_2))x - y \|^2 + \cdots \]
\[ + a_N \| P_C(I - \lambda(I - T_N))x - y \|^2 \]
\[ \leq \sum_{i=1}^{N} a_i \| x - y \|^2 = \| x - y \|^2. \]
Lemma 2.7. ([23]) Let \( \{a_n\} \) and \( \{b_n\} \) be two sequences of nonnegative real numbers such that
\[
a_{n+1} \leq a_n + b_n, \quad n \geq 1,
\]
where \( \sum_{n=0}^{\infty} b_n < \infty \). Then the sequence \( \{a_n\} \) is convergent.

3. Weak Convergence Theorem

In this section, we prove weak convergence theorem for finding a common element in the solution set of a class of pseudomonotone equilibrium problems and the set of fixed points of a finite family of \( \kappa \)-strictly pseudomonotone mappings in a real Hilbert space.

Theorem 3.1. Let \( C \) be a closed convex subset of a real Hilbert space \( H \) and \( F : C \times C \to \mathbb{R} \) be a bifunction satisfying (A1)–(A4). Let \( \{\kappa_1, \kappa_2, \ldots, \kappa_N\} \subset [0, 1) \) and \( \{T_i\}_{i=1}^N \) be a finite family of \( \kappa_i \)-strictly pseudomonotone mappings of \( C \) into itself such that \( \Omega := \bigcap_{i=1}^N F(T_i) \cap EP(F, C) \neq \emptyset \). Let \( x_0 \in C \) and \( \{x_n\} \) be a sequence generated by

\[
\begin{align*}
x_0 & \in C, \\
w_n & \in \partial_{\varepsilon_n} F(x_n, \cdot) x_n, \\
u_n & = P_C(x_n - \rho_n w_n), \\
x_{n+1} & = \alpha_n x_n + \beta_n \sum_{i=1}^N a_i P_C(I - \lambda_i^n (I - T_i)) x_n + \gamma_n u_n, \quad \forall n \in \mathbb{N},
\end{align*}
\]

where \( a, b, c, d, \lambda \in \mathbb{R}, a_i \in (0, 1), \) for all \( i = 1, 2, \ldots, N \) with \( \sum_{i=1}^N a_i = 1 \), \( \{\alpha_n\}, \{\beta_n\}, \{\gamma_n\} \subset [0, 1] \) with \( \alpha_n + \beta_n + \gamma_n = 1 \) and \( \{\delta_n\}, \{\epsilon_n\}, \{\lambda_i^n\} \subset (0, \infty) \) satisfying the following conditions:

(i) \( 0 < \lambda \leq \lambda_i^n \leq \min\{1 - \kappa_1, 1 - \kappa_2, \ldots, 1 - \kappa_N\} \) and \( \sum_{i=1}^N \lambda_i^n < \infty \) for all \( i = 1, 2, \ldots, N \);

(ii) \( 0 < a < \alpha_n, \beta_n, \gamma_n < b < 1 \);

(iii) \( \sum_{n=0}^{\infty} \delta_n = \infty, \sum_{n=0}^{\infty} \delta_n^2 < \infty, \) and \( \sum_{n=0}^{\infty} \delta_n \epsilon_n < \infty \).

Then the sequence \( \{x_n\} \) converges weakly to \( \bar{x} \in \Omega \).

Proof. First, we will show that \( \{x_n\} \) is bounded. Let \( p \in \Omega \). Then we have

\[
\begin{align*}
\|u_n - p\|^2 & = \|x_n - p\|^2 - \|u_n - x_n\|^2 + 2 \langle x_n - u_n, p - u_n \rangle \\
& \leq \|x_n - p\|^2 + 2 \langle x_n - u_n, p - u_n \rangle.
\end{align*}
\]

Since \( u_n = P_C(x_n - \rho_n w_n) \) and \( p \in C \), we get that

\[
\langle x_n - u_n, p - u_n \rangle \leq \rho_n \langle w_n, p - u_n \rangle.
\]
Substituting (3.3) into (3.2), we have
\[ \|u_n - p\|^2 \leq \|x_n - p\|^2 + 2\rho_n \langle w_n, p - u_n \rangle \]
\[ = \|x_n - p\|^2 + 2\rho_n \langle w_n, p - x_n \rangle + 2\rho_n \langle w_n, x_n - u_n \rangle \]
\[ \leq \|x_n - p\|^2 + 2\rho_n \langle w_n, p - x_n \rangle + 2\rho_n \|w_n\| \|x_n - u_n\| \]
(3.4)
\[ \leq \|x_n - p\|^2 + 2\rho_n \langle w_n, p - x_n \rangle + 2\delta_n \|x_n - u_n\|. \]
By using \( u_n = P_C(x_n - \rho_n w_n) \) and \( x_n \in C \) again, we get
\[ \|x_n - u_n\|^2 = \langle x_n - u_n, x_n - u_n \rangle \]
\[ \leq \rho_n \langle w_n, x_n - u_n \rangle \]
\[ \leq \rho_n \|w_n\| \|x_n - u_n\| \]
(3.5)
\[ \leq \delta_n \|x_n - u_n\|, \]
which implies that
\[ \|x_n - u_n\| \leq \delta_n. \]
By condition (iii), we have
(3.6)
\[ \lim_{n \to \infty} \|x_n - u_n\| = 0. \]
Combining (3.4) and (3.6), we obtain
(3.7)
\[ \|u_n - p\|^2 \leq \|x_n - p\|^2 + 2\rho_n \langle w_n, p - x_n \rangle + 2\delta_n^2. \]
Since \( w_n \in \partial_{\epsilon_n} F(x_n, x), p \in C \) and \( F(x, x) = 0 \) for each \( x \in C \), we obtain that
(3.8)
\[ \langle w_n, p - x_n \rangle \leq F(x_n, p) - F(x_n, x_n) + \epsilon_n \]
(3.9)
\[ = F(x_n, p) + \epsilon_n. \]
Thus, it follows from (3.8) and (3.9) that
(3.10)
\[ \|u_n - p\|^2 \leq \|x_n - p\|^2 + 2\rho_n F(x_n, p) + 2\rho_n \epsilon_n + 2\delta_n^2. \]
Form Lemma 2.6 (ii), we have
(3.11)
\[ \|\Sigma_{i=1}^N a_i P_C(I - \lambda^i_n (I - T_i)) x_n - p\|^2 \leq \|x_n - p\|^2. \]
From (3.1), (3.10) and (3.11), we have
(3.12)
\[ \|x_{n+1} - p\|^2 = \|\alpha_n x_n + (1 - \alpha_n) x_{n+1} + \beta_n \Sigma_{i=1}^N a_i P_C(I - \lambda^i_n (I - T_i)) x_n + \gamma_n u_n - p\|^2 \]
\[ \leq \alpha_n \|x_n - p\|^2 + \beta_n \|\Sigma_{i=1}^N a_i P_C(I - \lambda^i_n (I - T_i)) x_n - p\|^2 \]
\[ + \gamma_n \|u_n - p\|^2 - \alpha_n \beta_n \|x_n - \Sigma_{i=1}^N a_i P_C(I - \lambda^i_n (I - T_i)) x_n\|^2 \]
\[ \leq \alpha_n \|x_n - p\|^2 + \beta_n \|x_n - p\|^2 + \gamma_n \left( \|x_n - p\|^2 + 2\rho_n F(x_n, p) \right) \]
\[ + 2\rho_n \epsilon_n + 2\delta_n^2 \]
\[ - \alpha_n \beta_n \|x_n - \Sigma_{i=1}^N a_i P_C(I - \lambda^i_n (I - T_i)) x_n\|^2 \]
\[ = \|x_n - p\|^2 + 2\gamma_n \rho_n F(x_n, p) + 2\gamma_n \rho_n \epsilon_n + 2\gamma_n \delta_n^2 \]
\[ - \alpha_n \beta_n \|x_n - \Sigma_{i=1}^N a_i P_C(I - \lambda^i_n (I - T_i)) x_n\|^2. \]
Since $p \in EP(F, C)$ and $F$ is pseudomonotone on $F$ with respect to $p$, we get that $F(x_n, p) \leq 0$ for all $n \in \mathbb{N}$. Then from (3.12) it follows that
\[
\|x_{n+1} - p\|^2 \leq \|x_n - p\|^2 + 2\gamma_n \rho_n \epsilon_n + 2\gamma_n \delta_n^2
\]
\[
-\alpha_n \beta_n \|x_n - \sum_{i=1}^{N} a_i P_C(I - \lambda_i^0 (I - T_i)) x_n \|_2
\]
(3.13)
\[
\leq \|x_n - p\|^2 + 2\gamma_n \rho_n \epsilon_n + 2\gamma_n \delta_n^2.
\]

Let $\eta_n = 2\gamma_n \rho_n \epsilon_n + 2\gamma_n \delta_n^2$ for all $n \geq 0$. From condition (ii) and (iii), we get that $\Sigma_{n=0}^{\infty} \eta_n = \Sigma_{n=0}^{\infty} (2\gamma_n \rho_n \epsilon_n + 2\gamma_n \delta_n^2) \leq 2b \Sigma_{n=0}^{\infty} \rho_n \epsilon_n + 2b \Sigma_{n=0}^{\infty} \delta_n^2 < +\infty$

Now applying Lemma 2.7 to (3.13), we obtain that the $\lim \|x_n - p\|$ exists, i.e.
\[
\lim_{n \to \infty} \|x_n - p\| = \bar{a} \text{ for some } \bar{a} \in C.
\]
This $\{x_n\}$ is bounded. Also, it easy to verify that $\{u_n\}$ and $\{\sum_{i=1}^{N} a_i P_C(I - \lambda_i^0 (I - T_i)) x_n\}$ are also bounded.

Next, we will show that $\limsup_{n \to \infty} F(x_n, p) = 0$ for any $p \in \Omega$. Since $F$ is pseudomonotone on $C$ and $F(p, x_n) \geq 0$, we have $-F(x_n, p) \geq 0$. From (3.12) and condition (ii), we have
\[
2\gamma_n \rho_n [-F(x_n, p)] \leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2
\]
\[
+ 2\gamma_n \rho_n \epsilon_n + 2\gamma_n \delta_n^2
\]
(3.14)
\[
\leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 + 2b \rho_n \epsilon_n + 2b \delta_n^2.
\]

Summing up (3.14) for every $n$, we obtain
\[
0 \leq 2 \sum_{n=0}^{\infty} \gamma_n \rho_n [-F(x_n, p)]
\]
(3.15)
\[
\leq \|x_0 - p\|^2 + 2b \sum_{n=0}^{\infty} \rho_n \epsilon_n + 2b \sum_{n=0}^{\infty} \delta_n^2 < +\infty.
\]

By the assumption $(A_4)$, we can find a real number $w$ such that $\|w_n\| \leq w$ for every $n$. Setting $\Gamma := \max\{\sigma, w\}$, where $\sigma$ is a real number such that $0 < \sigma_n < \sigma$ for every $n$, it follows from (ii) that
\[
0 \leq 2a \frac{\alpha_n}{F} \sum_{n=0}^{\infty} \delta_n [-F(x_n, p)]
\]
(3.16)
\[
\leq 2 \sum_{n=0}^{\infty} \gamma_n \rho_n [-F(x_n, p)] < +\infty,
\]
which implies that
\[
0 \leq \sum_{n=0}^{\infty} \delta_n [-F(x_n, p)] < +\infty.
\]
(3.18)
Combining with $-F(x_n, p) \geq 0$ and $\sum_{n=0}^{\infty} \delta_n = \infty$, we can deduced that 
\[
\limsup_{n \to \infty} F(x_n, p) = 0
\]
as desired.

Next, we will show that $\omega_\omega(x_n) \subset \Omega$, where $\omega_\omega(x_n) = \{x \in H : x_{n_i} \to x\}$ for some subsequence $\{x_{n_i}\}$ of $\{x_n\}$. Indeed since $\{x_n\}$ is bounded and $H$ is reflexive, $\omega_\omega(x_n)$ is nonempty. Let $\bar{x} \in \omega_\omega(x_n)$. Then there exists subsequence $\{x_{n_i}\}$ of $\{x_n\}$, converging weakly to $\bar{x}$, that is $x_{n_i} \to \bar{x}$ as $i \to \infty$. By the convexity, $C$ is weakly closed and hence $\bar{x} \in C$. Since $F(\cdot, p)$ is weakly upper semicontinuous for $p \in \Omega$, we obtain
\[
F(\bar{x}, p) \geq \limsup_{i \to \infty} F(x_n, p) = \lim_{i \to \infty} F(x_{n_i}, p) = \limsup_{n \to \infty} F(x_n, p) = 0.
\]
(3.19)

Since $F$ is pseudomonotone with respect to $p$ and $F(p, \bar{x}) \geq 0$, we obtain $F(\bar{x}, p) \leq 0$. Thus $F(\bar{x}, p) = 0$. Furthermore, by assumption $(A_3)$, we get that $\bar{x} \in EP(F, C)$. On the other hand, from (3.13) and conditions (ii)–(iii), we have
\[
\alpha_n \beta_n \|x_n - \sum_{i=1}^{N} a_i P_C(I - \lambda_n^i(I - T_i))x_n\|^2
\leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 + 2\gamma_n \rho_n \epsilon_n + 2\gamma_n \delta_n^2
\leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 + 2\rho_n \epsilon_n + 2\delta_n^2
\]
(3.20)
taking the limit as $n \to \infty$ yields
\[
\lim_{n \to \infty} \|x_n - \sum_{i=1}^{N} a_i P_C(I - \lambda_n^i(I - T_i))x_n\| = 0.
\]
(3.21)

Now, we will show that $\bar{x} \in \bigcap_{i=1}^{N} F(T_i)$. Assume that $\bar{x} \notin \bigcap_{i=1}^{N} F(T_i)$. By Lemma 2.6, we have $\bar{x} \notin F(\sum_{i=1}^{N} a_i P_C(I - \lambda_n^i(I - T_i)))$. From the Opial’s condition, (3.21) and condition (i), we can write
\[
\liminf_{i \to \infty} \|x_{n_i} - \bar{x}\| < \liminf_{i \to \infty} \|x_{n_i} - \sum_{i=1}^{N} a_i P_C(I - \lambda_n^i(I - T_i))\bar{x}\|
\leq \liminf_{i \to \infty} \left( \|x_{n_i} - \sum_{i=1}^{N} a_i P_C(I - \lambda_n^i(I - T_i))x_{n_i}\| + \|\sum_{i=1}^{N} a_i P_C(I - \lambda_n^i(I - T_i))x_{n_i} - \sum_{i=1}^{N} a_i P_C(I - \lambda_n^i(I - T_i))\bar{x}\| \right)
\leq \liminf_{i \to \infty} \left( \|x_{n_i} - \bar{x}\| + \sum_{i=1}^{N} a_i \lambda_n^i \|I - T_i\| \|x_{n_i} - (I - T_i)\bar{x}\| \right)
\leq \liminf_{i \to \infty} \|x_{n_i} - \bar{x}\|.
\]
This is a contradiction. Then $\bar{x} \in \bigcap_{i=1}^{N} F(T_i)$. Thus $\bar{x} \in EP(F, C) \cap F(T) = \Omega$ and so $\omega_\omega(x_n) \subset \Omega$. 

Weak and Strong Convergence of Hybrid Subgradient Method
93
Finally, we prove that \( \{x_n\} \) converge weakly to an element of \( \Omega \). It’s sufficient to show that \( \omega_n(x_n) \) is a single point set. Taking \( z_1, z_2 \in \omega_n(x_n) \) arbitrarily, and let \( \{x_{n_k}\} \) and \( \{x_{n_m}\} \) be subsequence of \( \{x_n\} \) such that \( x_{n_k} \to z_1 \) and \( x_{n_m} \to z_2 \) respectively. Since \( \lim_{n \to \infty} \|x_n - p\| \) exists for all \( p \in \Omega \) and \( z_1, z_2 \in \Omega \), we get that \( \lim \|x_n - z_1\| \) and \( \lim \|x_n - z_2\| \) exist. Now, assume that \( z_1 \neq z_2 \), then by the Opial’s condition,

\[
\lim_{n \to \infty} \|x_n - z_1\| = \lim_{k \to \infty} \|x_{n_k} - z_1\| < \lim_{k \to \infty} \|x_{n_k} - z_2\| = \lim_{n \to \infty} \|x_n - z_2\| = \lim_{m \to \infty} \|x_{n_m} - z_2\| < \lim_{m \to \infty} \|x_{n_m} - z_1\| = \lim_{n \to \infty} \|x_n - z_1\|,
\]

(3.22)

which is a contradiction. Thus \( z_1 = z_2 \). This show that \( \omega_n(x_n) \) is single point set. i.e. \( x_n \to \bar{x} \). This completes the proof. \( \square \)

If we set \( \kappa_i = 0 \) for all \( i = 1, 2, \ldots, N \) then we get the following Corollary.

**Corollary 3.2.** Let \( C \) be a closed convex subset of a real Hilbert space \( H \) and \( F : C \times C \to \mathbb{R} \) be a bifunction satisfying (A1)–(A4). Let \( \{T_i\}_{i=1}^N \) be a finite family of nonspreading mappings of \( C \) into itself such that \( \Omega := \bigcap_{i=1}^N F(T_i) \cap EP(F, C) \neq \emptyset \). Let \( x_0 \in C \) and \( \{x_n\} \) be a sequence generated by

\[
\begin{align*}
x_0 & \in C, \\
w_n & \in \partial_{\rho_n} F(x_n, \cdot)x_n, \\
u_n & = P_C(x_n - \rho_n w_n), \\
p_n & = \max_{i \in [1, N]} \delta_n, \\
x_{n+1} & = \alpha_n x_n + \beta_n \sum_{i=1}^N a_i P_C(I - \lambda^i_n (I - T_i))x_n + \gamma_n u_n, \forall n \in \mathbb{N},
\end{align*}
\]

(3.23)

where \( a, b, c, d, \lambda \in \mathbb{R}, \ a_i \in (0, 1), \) for all \( i = 1, 2, \ldots, N \) with \( \sum_{i=1}^N a_i = 1, \ \{\alpha_n\}, \ \{\beta_n\}, \ \{\gamma_n\} \subset [0, 1] \) with \( \alpha_n + \beta_n + \gamma_n = 1 \) and \( \{\delta_n\}, \ \{\epsilon_n\}, \ \{\lambda_n\} \subset (0, \infty) \) satisfying the following conditions:

(i) \( 0 < \alpha_n < \lambda_i^2_n \) and \( \sum_{n=1}^\infty \lambda_i^2_n < \infty \) for all \( i = 1, 2, \ldots, N \);

(ii) \( 0 < a < \alpha_n, \beta_n, \gamma_n < b < 1 \);

(iii) \( \sum_{n=1}^\infty \delta_n = \infty, \ \sum_{n=1}^\infty \delta_n^2 < \infty, \) and \( \sum_{n=1}^\infty \delta_n \epsilon_n < \infty \).

Then the sequence \( \{x_n\} \) converges weakly to \( \bar{x} \in \Omega \).
4. Strong Convergence Theorem

In this section, to obtain strong convergence result, we add the control condition \( \lim_{n \to \infty} \alpha_n = \frac{1}{2} \), and then we get the strong convergence theorem for finding a common element in the solution set of a class of pseudomonotone equilibrium problems and the set of fixed points of a finite family of \( \kappa \)-strictly pseudononspreading mappings in a real Hilbert space.

**Theorem 4.1.** Let \( C \) be a closed convex subset of a real Hilbert space \( H \) and \( F : C \times C \to \mathbb{R} \) be a bifunction satisfying (A1)–(A4). Let \( \{\kappa_1, \kappa_2, \ldots, \kappa_N\} \subset [0,1) \) and \( \{T_i\}_{i=1}^N \) be a finite family of \( \kappa_i \)-strictly pseudononspreading mappings of \( C \) into itself such that \( \Omega := \bigcap_{i=1}^N F(T_i) \cap EP(F,C) \neq \emptyset \). Let \( x_0 \in C \) and \( \{x_n\} \) be a sequence generated by

\[
\begin{align*}
(4.1) \quad x_0 & \in C, \\
w_n & \in \partial_{\epsilon_n} F(x_n, \cdot)x_n, \\
u_n & = P_C(x_n - \rho_n w_n), \quad \rho_n = \frac{1}{\sum_{i=1}^N |a_i|} \\
x_{n+1} & = \alpha_n x_n + \beta_n \lambda_i^{n} a_i P_C(I - \lambda_i^{n}(I - T_i))x_n + \gamma_n u_n, \; \forall n \in \mathbb{N},
\end{align*}
\]

where \( a, b, c, d, \lambda \in \mathbb{R} \), \( a_i \in (0,1) \), for all \( i = 1, 2, \ldots, N \) with \( \sum_{i=1}^N a_i = 1 \), \( \{\alpha_n\}, \{\beta_n\}, \{\gamma_n\} \subset [0,1] \) with \( \alpha_n + \beta_n + \gamma_n = 1 \) and \( \{\delta_n\}, \{\epsilon_n\}, \{\lambda_i^n\} \subset (0,\infty) \) satisfying the following conditions:

(i) \( 0 < \lambda \leq \lambda_i^n \leq \min\{1 - \kappa_1, 1 - \kappa_2, \ldots, 1 - \kappa_N\} \) and \( \sum_{n=1}^\infty \lambda_i^n < \infty \) for all \( i = 1, 2, \ldots, N \);

(ii) \( 0 < a < \alpha_n, \beta_n, \gamma_n < b < 1 \) and \( \lim_{n \to \infty} \alpha_n = \frac{1}{2} \);

(iii) \( \sum_{n=0}^\infty \delta_n = \infty, \sum_{n=0}^\infty \delta_n^2 < \infty, \) and \( \sum_{n=0}^\infty \delta_n \epsilon_n < \infty \).

Then the sequence \( \{x_n\} \) converges strongly to \( \bar{x} \in \Omega \).

**Proof.** By a similar argument to the proof of Theorem 3.1 and (2.4), we have

\[
\|\sum_{i=1}^N a_i P_C(I - \lambda_i^n(I - T_i))x_n - P_{\Omega}(x_n)\|^2 \leq \|\sum_{i=1}^N a_i P_C(I - \lambda_i^n(I - T_i))x_n - x_n\|^2 - \|x_n - P_{\Omega}(x_n)\|^2
\]

and

\[
(4.2) \quad \|u_n - P_{\Omega}(x_n)\|^2 \leq \|u_n - x_n\|^2 - \|x_n - P_{\Omega}(x_n)\|^2.
\]

It follows from (4.2) and condition (ii) that
\[ \|x_{n+1} - P_\Omega(x_{n+1})\|^2 \leq \|\alpha_n x_n + \beta_n \sum_{i=1}^{N} a_i P_C(I - \lambda_i^* (I - T_i))x_n + \gamma_n u_n - P_\Omega(x_n)\|^2 \]

Since \( \Omega \) is convex, for all \( m > n \), we have \( \frac{1}{2}(P_\Omega(x_m) + P_\Omega(x_n)) \in \Omega \), and therefore

\[ \|P_\Omega(x_m) - P_\Omega(x_n)\|^2 = 2\|x_m - P_\Omega(x_m)\|^2 + 2\|x_m - P_\Omega(x_n)\|^2 - 4\|x_m - \frac{1}{2}(P_\Omega(x_m) + P_\Omega(x_n))\|^2 \]

\[ \leq 2\|x_m - P_\Omega(x_n)\|^2 + 2\|x_m - P_\Omega(x_n)\|^2 - 4\|x_m - P_\Omega(x_n)\|^2 \]

\[ = 2\|x_m - P_\Omega(x_n)\|^2 - 2\|x_m - P_\Omega(x_n)\|^2. \]

Using (3.13) with \( p = P_\Omega(x_n) \), we have

\[ \|x_m - P_\Omega(x_n)\|^2 \leq \|x_{m-1} - P_\Omega(x_n)\|^2 + \eta_{m-1} \]

\[ \leq \|x_{m-2} - P_\Omega(x_n)\|^2 + \eta_{m-1} + \eta_{m-2} \]

\[ \leq ... \]

\[ \leq \|x_n - P_\Omega(x_n)\|^2 + \sum_{j=n}^{m-1} \eta_j, \]

where \( \eta_j = 2\gamma_j \rho_j \epsilon_j + 2\gamma_j \delta_j^2 \). It follows from (4.4) and (4.5) that

\[ \|P_\Omega(x_m) - P_\Omega(x_n)\|^2 \leq 2\|x_m - P_\Omega(x_n)\|^2 + 2 \sum_{j=n}^{m-1} \eta_j - 2\|x_m - P_\Omega(x_m)\|^2. \]
Together with (4.3) and $\sum_{j=0}^{\infty} \eta_j < +\infty$, this implies that $\{P_{\Omega}(x_n)\}$ is a Cauchy sequence. Hence $\{P_{\Omega}(x_n)\}$ strongly converges to some point $x^* \in \Omega$. Moreover, we obtain

\begin{equation}
(4.7) \quad x^* = \lim_{i \to \infty} P_{\Omega}(x_{n_i}) = P_{\Omega}(\bar{x}) = \bar{x},
\end{equation}

which implies that $P_{\Omega}(x_i) \to x^* = \bar{x} \in \Omega$. Then from (4.3) and (4.7), we can conclude that $x_n \to \bar{x}$. This completes the proof. \hfill \Box

If we set $\kappa_i = 0$ for all $i = 1, 2, \ldots, N$ then we get the following Corollary.

**Corollary 4.2.** Let $C$ be a closed convex subset of a real Hilbert space $H$ and $F : C \times C \to \mathbb{R}$ be a bifunction satisfying (A1)-(A4). Let $\{T_i\}_{i=1}^{N}$ be a finite family of nonspreading mappings of $C$ into itself such that $\Omega := \bigcap_{i=1}^{N} F(T_i) \cap EP(F, C) \neq \emptyset$.

Let $x_0 \in C$ and $\{x_n\}$ be a sequence generated by

\begin{equation}
(4.8) \quad \begin{cases}
  x_0 \in C, \\
  w_n \in \partial_{x_n} F(x_n, \cdot) x_n, \\
  u_n = P_{C}(x_n - \rho_n w_n), \\
  \rho_n = \frac{\delta_n}{\max\{\sigma_n, \|w_n\|\}}, \\
  x_{n+1} = \alpha_n x_n + \beta_n \sum_{i=1}^{N} a_i P_{C}(I - \lambda_n(I - T_i))x_n + \gamma_n u_n, \quad \forall n \in \mathbb{N},
\end{cases}
\end{equation}

where $a, b, c, d, \lambda \in \mathbb{R}$, $a_i \in (0, 1)$, for all $i = 1, 2, \ldots, N$ with $\sum_{i=1}^{N} a_i = 1$, $\{\alpha_n\}, \{\beta_n\}, \{\gamma_n\} \subset [0, 1]$ with $\alpha_n + \beta_n + \gamma_n = 1$ and $\{\delta_n\}, \{\epsilon_n\}, \{\lambda_n\} \subset (0, \infty)$ satisfying the following conditions:

(i) $0 < \lambda \leq \lambda_n' < 1$ and $\sum_{n=1}^{\infty} \lambda_n' < \infty$ for all $i = 1, 2, \ldots, N$;

(ii) $0 < a < \alpha_n, \beta_n, \gamma_n < b < 1$ and $\lim_{n \to \infty} \alpha_n = \frac{1}{2}$;

(iii) $\sum_{n=0}^{\infty} \delta_n = \infty$, $\sum_{n=0}^{\infty} \delta_n^2 < \infty$, and $\sum_{n=0}^{\infty} \delta_n \epsilon_n < \infty$.

Then the sequence $\{x_n\}$ converges weakly to $\bar{x} \in \Omega$.
