## Introduction

In this paper, we described that the parts of ginseng growing above the earth's surface (stem, leave and flower bud) were extracted by ether, a yellow volatile oil (GVO) 0.2 wt% has been obtained, 56 compounds were determined by the analytical method of GC/MS, 19 of them are sesquiterpenes, 22 of them have been checked by the method of GC/FTIR. The volatile oil can send forth delicate fragrance of ginseng and the sesquiterpenes make up the characteristic constituents of the oil and sesquiterpene compounds were classified into the same group. This result has a practical value; this volatile oil, the by-product on ginseng trade, can be used to prepare the perfume and the medicine.

## Experiment

1. GC/MS: A gas chromatograph with a Hp-5 capillary column (i.d. 0.2 mm × 25 m) was used.

The mass analyzer: ITD (Ion Trap Detector) and NBS (The National Bureau of standards, U.S.A.) library of 42222 spectra were used.

2. GC/FTIR: A gas chromatograph with a OV-101 capillary column (i.d. 0.53 mm × 12 M) was used.

FTIR: The FTIR spectrometer has the EPA Environmental Protection Agency U.S.A.) Vapor Phase IR Spectral Library with 3300 Standard spectra.

3. The silica gel GF<sub>254</sub> TLC was used, and the n-hexane-ethylacetate (10:8:1) as flowing phase. The sesquiterpenes were obtained from this oil. The sesquiterpenes were isolated in the first group ( $R_f = 0.91$ ).

## Result and Discussion

1. GC/MS analysis: The repeated ions chromatogram of the volatile oil (Fig. 1) shows 128 peaks, which are explained.

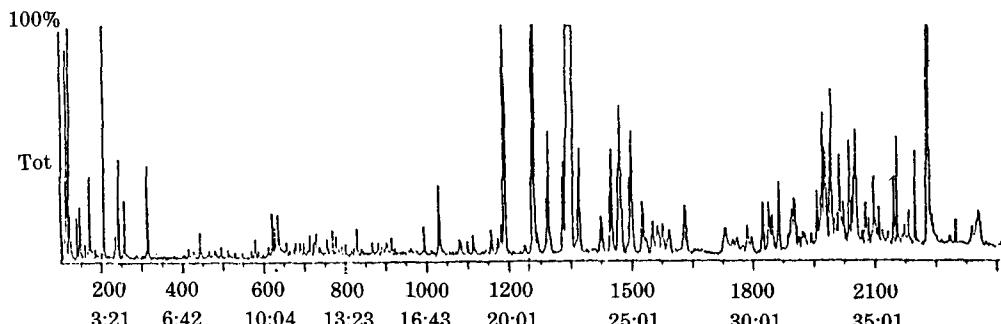

Fig. 1. The chromatogram of the volatile oil of Jilin ginseng GVO by GC/MS

2. 56 compounds in the total oil have been determined (Table 1) and the 20 compounds are new (Table 2). The percentage of the area of each peak has been calculated out as A% by using the integral programme.

3. Among the 56 compounds, 19 are sesquiterpenes with their molecular ions peaks as 204, and molecular formula as C<sub>15</sub>H<sub>24</sub> and form a group of characteristic compounds.

4. GC/FTIR analysis: Because the sensitivity of FTIR is lower than that of MS, and only a few standard spectrograms have been stocked. In this case, the column with a wide diameter and an apparatus of no split stream sample were used in the experiment. Thus the sensitivity was raised to 2 orders of magnitude 22 organic compounds from the oil have been determined, five of them are sesquiterpenes. The contrast relationship between the peaks of

GC/FTIR and the peaks of GC/MS can be found in Fig. 2. Thus the components obtained by GC/MS were checked by GC/FTIR, which can also be used to distinguish some isomers, but the MS can be not.

5. The parts of ginseng growing above the earth's surface are the by-product in a ginseng garden. The volatile oil extracted from it can be used as the additive for processing or making cigarette, sugar, tea, drink, medicine, cosmetics and as the reference for making up essence artificially. If the volatile oil is extracted firstly and then the ginsenoside from the parts of ginseng growing above the earth's surface not only the quality of ginsenoside can be raised, but also the economic benefit can be increased by the comprehensive utilization.

6. We found that the GVO can inhibit the cancer cells growth.
