

Ellipticities and Position Angles of Semi-Major Axes for 7 Globular Clusters

Jeong-Ju Lee and Mun-Suk Chun

Dept. of Astronomy and Atmospheric Science, Yonsei University

Using the B-band CCD images of 7 southern globular clusters, we have examined ellipticities($\varepsilon = 1-b/a$) and position angles of semi-major axes of clusters. The average ellipticity of each cluster in the central region is near 0.1. The fitting ellipse to isophotes was made using the STSDAS software package. The ellipticities show the radial variation within a sample clusters.
