Abstract

In this paper, the authors are going to describe a new species of *Castianeira paikdoensis* sp. nov.(백도나나니거미, 新稱) from Korea. The palpal organ of this new species differs from that of *C. trifasciata* YIN, 1996 by 1) abdominal dorsal patterns : the former with 1 median transverse band of white hairs, 2 posterior instead of the latter with 3 anterior 2) tegulum shape and different spiral duct-form sperm reservoir. Up to the present, only species of genus *Castianeira* has been recorded in Korea. The specimen collected from Piakdo, Kosung-gun, Kangwon-do is deposited in the Arachnological Institute of Korea.
