

殺菌劑 Hexaconazole의 水稻 生育에 미치는 Anti-Gibberellin的效果

洪 振 穎*, 權 容 雄

Anti-Gibberellic Effect of Fungicide Hexaconazole on the Growth and Yield of Rice

Hong Jin Suk, Kwon Yong Woong

Department of Agronomy, Seoul National University

실험 목적 : 殺菌劑 hexaconazole이 여러 triazole系 農藥 중에서도 Anti-GA機能을 갖는 paclobutrazol 및 uniconazole과 化學構造가 매우 비슷하며 벼 농사에 있어서 잎집무늬마름병약으로 이미 登錄 사용되고 있으므로 이 藥劑의 Anti-GA 機能 有無를 檢討하고, Anti-GA的 기능이 있을 경우 벼 농사에서 倒伏輕減劑로 쓰이고 있는 既存의 Anti-GA化合物들의 效能과 比較하여 도복경감제로서의 利用 可能性과 適切한 使用時期 및 使用量을 밝히고자 하였다.

재료 및 방법 : Hexaconazole을 種 仁 및 幼苗에 처리하였을 때 나타나는 生育反應을 倒伏輕減劑이며 Anti-GA인 inabenfide, paclobutrazol, uniconazole을 처리하였을 때의 生育 반응과 비교하여 그의 類似性을 통해 hexaconazole의 Anti-GA 機能 有無를 檢討하였고, 實際 園場에서는 藥量과 處理時期를 달리하여 hexaconazole 및 inabenfide, paclobutrazol, uniconazole을 처리하였고, 각 약제에 대한 벼의 生育 및 收量에 미치는 影響을 調査하여 比較하였다.

결과 요약

1. 벼 씨 豐芽中 α -amylase 誘起를 10%抑制하는 處理濃度는 hexaconazole은 $1.1 \times 10^{-4} M$ 이었고 inabenfide는 $9.7 \times 10^{-3} M$, paclobutrazol과 uniconazole은 각각 $2.1 \times 10^{-7} M$ 및 $1.2 \times 10^{-7} M$ 이었다.
2. 幼苗의 葉生長에 대해 hexaconazole은 inabenfide 및 uniconazole과 外形上 同質의 藥劑處理效果를 보였고, 第 2葉期 幼苗에 莖葉處理를 1회하였을 경우 葉伸長抑制效果는 $1 \times 10^{-3} M$ 濃度에서 hexaconazole 28%, uniconazole 37%, inabenfide 22%이었다.
3. 어린모를 移秧栽培하고 分蘖盛期 및 後期, 出穗前 40日~15일에 hexaconazole, inabenfide, uniconazole을 처리하였을 경우 莖葉의 葉綠素含量增加, 草長의 短縮, 穩長의 短縮, 穩稈의 挫折重增加 等 모든 生育反應에 있어서 hexaconazole은 Anti-GA的 效果를 보였는데 대체로 hexaconazole 200~300g a.i./ha 처리는 inabenfide 1200g a.i./ha 및 uniconazole 12g a.i./ha 處理效果와 比等하였고 莖葉의 葉綠素含量 持續效果는 inabenfide 및 uniconazole보다 多少 길었다.
4. 벼 品種 화성벼와 일품벼를 供試한 2년간의 園場實驗에서 어린모를 移秧한 후 25日~35일에 hexaconazole, inabenfide 또는 uniconazole을 適量 처리하는 경우 有效分蘖數가增加하고 葉綠素含量이 登熟期까지 높게維持되면서도 草長 및 穩長이 10%정도 短縮되고, 穩의 挫折重이增加하고 倒伏指數가 減少하여 倒伏輕減效果가 뚜렷할 뿐 아니라 收量도 10%정도增加하였다.
5. Hexaconazole, inabenfide 및 uniconazole은 處理時期가 出穗前 40日이후 出穗期에 가까운 時期에 處理할수록 穩長短縮效果는 커지나 穩長 및 穩花數의 減少, 그에 따른 收量減少의 危險이 증가하였다.
6. Hexaconazole은 以上의 여러 결과로 보아 paclobutrazol, uniconazole 및 inabenfide와 매우 비슷한 GA生合成 抑制作用性을 갖고 있으며 그 力價(potency)은 inabenfide보다는 뚜렷이 크고 paclobutrazol이나 uniconazole보다는 뚜렷이 작으며, 벼 栽培에 있어서 倒伏輕減劑 및 生育調節劑로 活用할 수 있다고 생각한다.

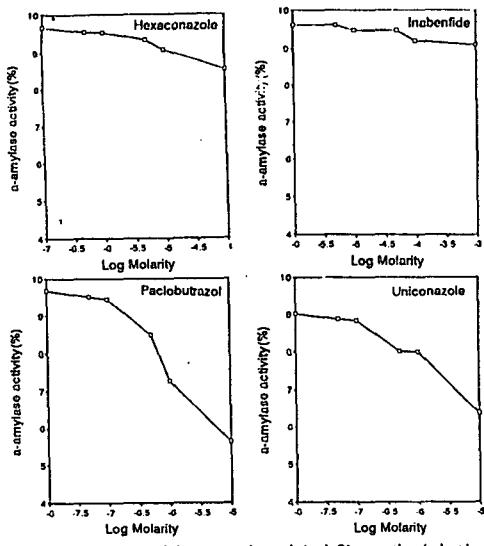

Fig 1. Effect of hexaconazole and Anti-GAs on the induction of α -amylase activity in germinating rice seeds. α -amylase activity(%) means the percent of starch broken down by enzyme extract for one minute and was calculated as following equation :

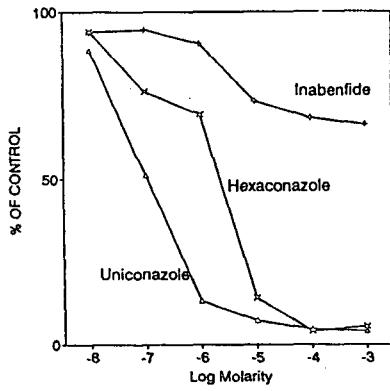

Fig 4. Relative inhibition of shoot elongation for 10 days of the rice seedlings by hexaconazole and Anti-GAs treated to the pregerminated seeds.
