A total of 2,344 individuals of *Allochthonius buanensis* Lee was collected from March 1993 to February 1995 at the Piagol, Mt. Chiri. Of these, 42% were protonymphs, 25% were deutonymphs, 11% were tritonymphs, and 22% were adults. Sixty per cent of all specimens were obtained below 600m in altitude. Temperature seems to be the key factor controlling the distribution of *A. buanensis*, thus restricts its inhabitation at higher altitudes. Female vs. male ratio of this species was approximately 1 : 2
