The King Sejong reign period was the golden age for the science and technology in Korea. Royal astronomers were actively engaged on the construction of astronomical instruments and astronomical observatory. Those instruments were, however, vanished totally and now we find a few debris only. In order to investigate the old instruments and to demonstrate for the publics, therefore, two recent reconstructions of Ganui, a simplified armillary, and Gyupio, a gnomon, in the King Sejong reign period have been attempted. This paper introduced these instruments reproduced by using the records in the Chosun Wangjo Silloks and other sources available.
