After the Convention on Biological Diversity, BIKNet(Biodiversity Information of Korea Network) should be established for the biological resource inventory effective of biological diversity to the mutual use of resources for the country. It's provide active exchange of information pertaining to the national monitoring system for diversity conservation, management effectively, sustainable use system, environment information for multidisciplinary team of scientist who conduct leading-edge research in the biological and natural sciences. BIKNet make plans for service for biological diversity information of biodiversity related bioresource-animal, plant, microorganism, etc.-species diversity, genetic diversity, ecological diversity, benefic conservation, sustainable use, national strategy, biodiversity monitoring system and support for the strengthen education, monitoring information of national bioresource management effectively.
