We present a study of the structures of five globular clusters in the Local Group dwarf elliptical galaxies NGC 185 and NGC 205: three globular clusters (FJJ III, IV and V) in NGC 185 and two globular clusters (Hubble II and V) in NGC 205. This study is based on the *V* and *I* images taken with HST/WFPC2. Surface brightness and color profiles of the clusters are obtained from the surface photometry. Then structural parameters of the clusters are derived. These results are compared with those of globular clusters in other nearby galaxies.
