

음성의 회복(편측 혹은 양측 성대마비의 치료)

연세대학교 의과대학 이비인후과학교실

김영호

A. 미주신경의 신경해부: neuroanatomy of the vagus nerve

1) Pharyngeal nerve

- from upper part of the inferior (nodose) ganglion
- descends between external and internal carotid artery
- form pharyngeal plexus with IX, external laryngeal nerve
- distribute to the pharynx, all muscles of the soft palate except the tensor veli palatini m.

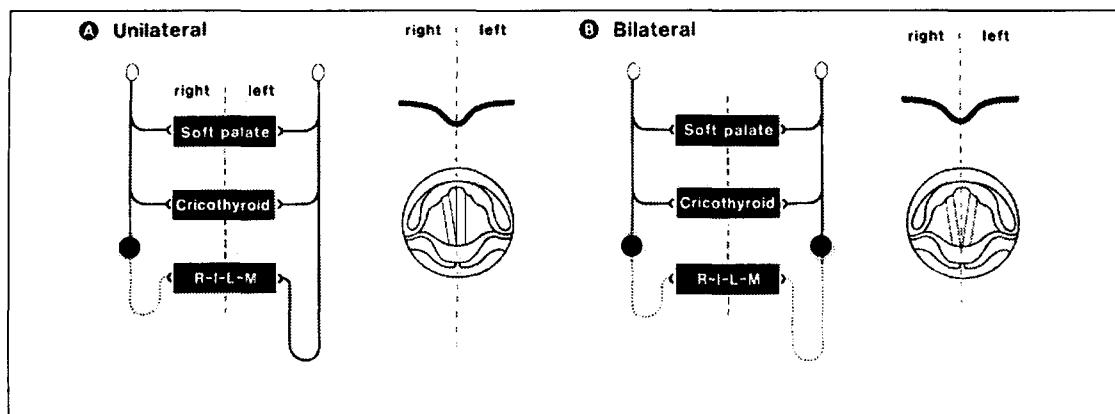

2) Superior laryngeal nerve

- from the inferior ganglion
- divides into internal & external laryngeal nerve
 - a) internal branch
 - sensory fibers from laryngeal mucosa above the level of VC and from muscle spindle & stretch receptor
 - b) external branch
 - motor branch to CT m.

3) Recurrent laryngeal nerve (RLN)

- Rt. RLN loops subclavian artery
- Lt. RLN loops arch of aorta
- ascend alongside T-E groove, entering the larynx behind CT joint
- nerve divides two or more branches before entering the larynx (70~80%)
- sensory fiber from laryngeal mucosa under VC level

B. Lesions of the RLN

1) Unilateral	2) Bilateral
<ul style="list-style-type: none"> • VF fixed in paramedian position • Intact CT m. • Capable of VF stretching anteroposteriorly • Act as adductor (VC closer to midline) • Breathy-hoarse voice quality • reduced loudness • Diplophonia, falsetto pitch breaks 	<ul style="list-style-type: none"> • VF adducted to close midline - Virtually normal phonation • Abductors paralysis - Inhalatory stridor - compromising airway - respiratory distress

C. Pathophysiologic change of RLN after injury (Canine study)

In general, neuropraxia: normal recovery

axonotmesis & neurotmesis : recovery after Wallerian degeneration

1) Crushing injury to RLN

- In inspiration, normal spontaneous abduction 27 weeks after injury
- In TA muscle, fibrillation potential disappeared after 27~30 weeks

2) Cut & immediate EEA of nerve trunk

- In inspiration, abnormal movement: shivering, medial bulging
← misdirection of rerouting of abductor nerve fibers into TA muscle
- In TA muscle, fibrillation potential disappeared after 24~27 weeks

D. Causes of vocal cord paralysis

1) Causes of vocal cord paralysis in Korea

E 진단

1) 순서

- 듣기 평가
- 내시경 검사
 - Rhinolaryngo-fiberscopy
 - Rigid tele-laryngoscopy
 - Video-stroboscopy
- Electroglossography (EGG)
- Aero-dynamic tests
- Acoustic analysis of voice, etc.
- Laryngeal EMG

2) 기타 검사

a. 필수 검사:

- 후두내시경검사 (Laryngoscopy/Stroboscopy)
- Chest PA
- Neck CT including upper mediastinum
- Esophagogram/EGD
- Ultrasonogram(Neck)

b. Optional:

- Chest CT
- Skull base CT/MR
- VDRL/FTAABS
- Viral marker

F. 증상 및 증후

1) 음성의 변화

- 2) 흡인 연하장애
- 3) 호흡곤란

G. 치료

1) 보존적 치료

- a. 기준
 - In selected cases of paramedian fixation of unilateral vocal cord
 - Compensation is possible by normal side
- b. 기간
 - Observation 6~12 months avoiding aspiration
 - c. 음성치료: pushing methods, accent method

2) 수술적 치료

a. 편측 성대마비의 치료

- 성대내전술
 - 주입술: Gelfoam
 - Teflon & Silicone
 - Collagen: Bovine, Autologous, Micronized Alloderm
 - Fat
 - Fascia
- Type I thyroplasty
- Arytenoid adduction
- 신경재식술(Reinnervation)

b. 양측 성대마비의 치료

- Tracheotomy
- Arytenoidectomy
 - Open
 - Laser
 - Partial
- Cordotomy
- Reinnervation
- Pacemaker
