

1-5. Robber Flies of South Korea

Charles Young¹ and Byung-Jin Kim

¹ Division of English literature, Wonkwang University
Division of Biological Science, Wonkwang University

Very little work has been done on South Korean Asilidae and the peninsula offers a wide range of habitats rich in asilid fauna. South Korea's temperate climate offers conifer and deciduous belts, vast tracks of lower agricultural areas bordering the west coast, higher elevations many surrounding islands, including Cheju and Ullung which are semi-tropic.

As field and collecting work by C.L Young and taxonomic work by F. Geller-Grimm and Y. Tagawa progresses, a monograph is in preparation of South Korean Asilidae. The first part will deal with the subfamily Asilinae.
