Abstract

In this research, we propose an automatic knowledge acquisition and composite knowledge expression mechanism based on machine learning and relational database. Most of traditional approaches to develop a knowledge base and inference engine of expert systems were based on IF-THEN rules, AND-OR graph, Semantic networks, and Frame separately. However, there are some limitations such as automatic knowledge acquisition, complicate knowledge expression, expansibility of knowledge base, speed of inference, and hierarchies among rules. To overcome these limitations, many of researchers tried to develop an automatic knowledge acquisition, composite knowledge expression, and fast inference method. As a result, the adaptability of the expert systems was improved rapidly. Nonetheless, they didn't suggest a hybrid and generalized solution to support the entire process of development of expert systems.

Our proposed mechanism has five advantages empirically. First, it could extract the specific domain knowledge from incomplete database based on machine learning algorithm. Second, this mechanism could reduce the number of rules efficiently according to the rule extraction mechanism used in machine learning. Third, our proposed mechanism could expand the knowledge base unlimitedly by using relational database. Fourth, the backward inference engine developed in this study, could manipulate the knowledge base stored in relational database rapidly. Therefore, the speed of inference is faster than traditional text-oriented inference mechanism. Fifth, our composite knowledge expression mechanism could reflect the traditional knowledge expression method such as IF-THEN rules, AND-OR graph, and Relationship matrix simultaneously. To validate the inference ability of our system, a real data set was adopted from a clinical diagnosis classifying the dermatology disease.

Keywords: Expert systems, Composite knowledge expression, Relational database, Dermatology, Inference mechanism, Query.

1. Introduction

The purpose of this study is to develop an automatic knowledge base construction and maintaining mechanism. To this purpose, we combined automatic knowledge acquisition, relational database, and SQL-based backward inference engine. Automatic knowledge acquisition is commonly regarded as a major obstacle and bottleneck in the process of designing and implementing expert systems. Failure to acquire and encode appropriate amounts of relevant knowledge lead to limited consultation performance of the expert systems (Eriksson, 1991; Hong et al., 2002).

Knowledge used in inference could be acquired through one of two ways: either manual or automatic. Through the former researches automated knowledge acquisition tools are developed to help the knowledge engineer or even the expert himself to build and maintain the required knowledge systems (Gruber, 1987; Rafea et al., 2003). Unfortunately, however, expandability and reusability degree are still limited since no one of this tool integrates between task and

domain (Allsopp et al., 2002). This issue was one of our motivations in developing our mechanism. Our proposed mechanism has six advantages as follows.

- Automatic rule extraction from the specific and incomplete database.
- Efficient rule reduction.
- Unlimited knowledge base expansion.
- Speed up of the backward inference based on SQL.
- Reflection of the traditional knowledge expression methods.
- Grow up the reusability in knowledge base.

Therefore, our proposed mechanism could cover different classification problems and applied for different empirical diagnosis. To validate the performance of our proposed mechanism, we developed the prototype expert system shell.

Then, the dermatology data set (medical diagnosis) was referred from the UCI machine learning data repository (UCI ML Grup, 2003). Because this type of medical data was very difficult to predict (Brasil et al., 2001), and they all share the clinical features of

erythema and scaling with very little differences, the differential diagnosis of dermatopathy is a difficult problem (Rafea et al., 2003).

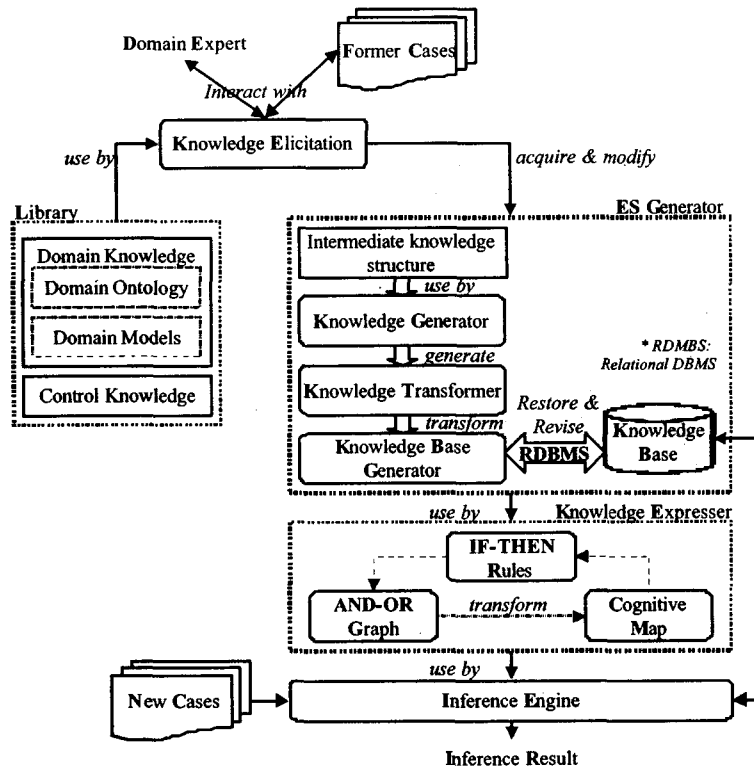

Figure 1. Research Methodology

2. Methodology

The architecture of the research methodology is graphically shown in Figure 1. The mechanism includes five main components namely: knowledge elicitation, library, ES (expert systems) generator, knowledge expresser, and inference engine. These components are similar with the research architecture of Rafea et al. (2003). In this study, however, we expanded Rafes et al. (2003)'s research architecture with other components as shown in Figure 1.

- **Library:** Contains both reusable domain knowledge and control knowledge.
- **Knowledge Elicitation:** Its main functions are to create, maintain, and restore knowledge elicited from the external input, fetch the relevant knowledge components from the library, and transform this knowledge into appropriate knowledge structure.
- **ES Generator.** Automatically generates an executable knowledge, which corresponds to the intermediate knowledge generated above. It contains knowledge generator, knowledge transformer, and knowledge base generator. During the knowledge transformation, ES Generator uses the RDBMS to restore and revise

her knowledge bases.

- **Knowledge Expresser:** Support the three knowledge expression methods such as, IF-THEN rules, AND-OR graph, and Relationship matrix. It could help users to understand the knowledge base efficiently.
- **Inference Engine:** In this study, we developed SQL-based backward inference engine. Therefore, its inference speed is faster than other text-oriented inference.

3. Implementation and application

We developed the prototype system SEES (Self Evolving Expert Systems) using the Visual Basic and Microsoft Access in a Windows-XP environment. SEES was composed of five components 1) Knowledge Elicitor, 2) Library, 3) ES Generator, 4) Knowledge Expresser, and 5) Inference Engine.

3.1 Library

Dermatology database contains 34 attributes, 33 of which are linear valued and one of them is nominal. The diseases in this group are psoriasis, seboric dermatitis, lichen planus, pityriasis rosea, cronic dermatitis, and pityriasis rubra pilaris (UCI ML Group, 2003).

Table 1. Domain knowledge for dermatopathy

(a) Clinical attributes

Clinical Attributes (takes values 0,1,2,3, unless otherwise indicated)	
Attribute #	Descriptions
v1	erythema
v2	scaling
v3	definite borders
v4	itching
v5	koebner phenomenon
v6	polygonal papules
v7	follicular papules
v8	oral mucosal involvement
v9	knee and elbow involvement
v10	scalp involvement
v11	family history (0 or 1)
v34	Age (linear)

(b) Histopathological attributes

Histopathological Attributes (take values 0,1,2,3)	
v12	melanin incontinence
v13	eosinophils in the infiltrate
v14	PNL infiltrate
v15	fibrosis of the papillary dermis
v16	Exocytosis
v17	acanthosis
v18	hyperkeratosis

v19	parakeratosis
v20	clubbing of the rete ridges
v21	elongation of the rete ridges
v22	thinning of the suprapapillary epidermis
v23	spongiform pustule
v24	munro microabcess
v25	focal hypergranulosis
v26	disappearance of the granular layer
v27	vacuolisation and damage of basal layer
v28	spongiosis
v29	saw-tooth appearance of retes
v30	follicular horn plug
v31	perifollicular parakeratosis
v32	inflammatory mononuclear infiltrate
v33	band-like infiltrate

Table 2. Number of instances and classes

Value	Class	Number of instances
1	psoriasis	112
2	seboreic dermatitis	61
3	lichen planus	72
4	pityriasis rosea	49
5	chronic dermatitis	52
6	pityriasis rubra pilaris	20
	Total	366

3.2 Knowledge Elicitor

The first step to be done is to cleanse the original data so that the preprocessed data may become more traceable (Lee et al., 2002). Table 3 shows the preprocessed data set.

Table 3. Preprocessed data set

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99	100	101	102	103	104	105	106	107	108	109	110	111	112	113	114	115	116	117	118	119	120	121	122	123	124	125	126	127	128	129	130	131	132	133	134	135	136	137	138	139	140	141	142	143	144	145	146	147	148	149	150	151	152	153	154	155	156	157	158	159	160	161	162	163	164	165	166	167	168	169	170	171	172	173	174	175	176	177	178	179	180	181	182	183	184	185	186	187	188	189	190	191	192	193	194	195	196	197	198	199	200	201	202	203	204	205	206	207	208	209	210	211	212	213	214	215	216	217	218	219	220	221	222	223	224	225	226	227	228	229	230	231	232	233	234	235	236	237	238	239	240	241	242	243	244	245	246	247	248	249	250	251	252	253	254	255	256	257	258	259	260	261	262	263	264	265	266	267	268	269	270	271	272	273	274	275	276	277	278	279	280	281	282	283	284	285	286	287	288	289	290	291	292	293	294	295	296	297	298	299	300	301	302	303	304	305	306	307	308	309	310	311	312	313	314	315	316	317	318	319	320	321	322	323	324	325	326	327	328	329	330	331	332	333	334	335	336	337	338	339	340	341	342	343	344	345	346	347	348	349	350	351	352	353	354	355	356	357	358	359	360	361	362	363	364	365	366
---	---	---	---	---	---	---	---	---	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

3.3 ES Generator

Machine learning algorithm such as C4.5 (Quinlan, 1988) was known to yield a set of rules. In this module, we regard a knowledge base as a domain expert system. Table 4 shows an excerpt of the derived rules. In this module we used Clementine 6.0.1 (SPSS, 2002) as a knowledge generator. The generated knowledge is encoded as production rules of the kind in Table 4. The rules are stored internally in the LISP form shown, from which the English version is generated. The tightly structured database form makes it possible for SEES to be designed to execute them in a form of SQL-based inference. The rules translated into a readable English format, as in Table 4.

Table 4. SEES production rule

<pre> PREMISE: (AND (LESS_THAN_OR_EQUAL_TO CNTXT BAND-LIKE-INFILTRATE 1) (GREATER_THAN CNTXT FIBROSIS-OF-THE- PAPILLARY-DERMIS 1)) ACTION: (CONCLUDE CNTXT CLASS CHRONIC- DERMATITIS) SEES' s English translation: IF 1) the band-like infiltrate is less than or equal to 1, and 2) fibrosis of the papillary dermis is greater than 1 THEN diagnosis is chronic dermatitis. </pre>

MYCIN produces an explanation by printing out an English version of the chain of rules used. TEIRESIAS, suggested by Davis (1977, 1980), can provide more complex explanation facilities. Each of rules is constructed from a predicate function with an associative triple OAV (object, attribute, value)- as its argument. Each premise clause typically has the following four components:

<Predicate function> / <Object> / <Attribute> / <Value>
(GREATER_THAN/CNTXT/FIBROSIS-OF-THE-PAPILLARY-DERMIS/1)

Figure 2 shows the knowledge base (rules) restored in relational database.

Figure 2. Knowledge base restored in relational database

3.4 Knowledge Expresser

Totally 81 rules were extracted by using APRIORI and C5.0 algorithms which were developed by Agrawal (1993) and Quinlan (1993). Table 5 shows the example of IF-THEN rules. Figure 3(a) and (b) shows the AND-OR graph and Relationship matrix separately.

Table 5. SEES' s OAV type production rule (IF-THEN rules)

Rule #71	IF	1) the fibrosis of the papillary dermis is equal to 3, AND 2) band-like infiltrate is equal to 1
	THEN	diagnosis is chronic dermatitis
Rule #80	IF	1) the eosinophils in the infiltrate is equal to 2, AND 2) perifollicular parakeratosis is equal to 3
	THEN	diagnosis is pityriasis rubra pilaris

(a). AND-OR graph for dermatology

(b) Relationship matrix

Figure 3. AND-OR graph and relationship matrix for knowledge base

3.5 Inference Engine

SQL-based backward inference algorithm was developed by Visual Basic. Therefore, rule consistency check and incompleteness check was easier than other traditional text-driven works.

After the construction of knowledge base, SEES ready to execute inference. In this sense, the SEES has backward inference engine, which uses SQL-based query. Table 6 shows the randomly selected patients' brief clinical data and histopathological data to validate the ability of SEES's inference engine.

V1	V2	V3	V4	V5	V6	V7	V8	V9	V10	V11	V12	V13	V14	V15	V16	V17	V18	V19	V20	V21	V22	V23	V24	V25	V26	V27	V28	V29	V30	V31	V32	V33	Age	Class
1	1	0	1	0	0	0	0	1	0	0	0	0	1	0	0	1	1	1	0	0	0	0	1	0	0	1	0	0	0	0	0	1	0	0
2	2	1	2	0	0	0	2	2	0	0	0	1	0	0	2	2	2	2	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
1	1	0	0	0	1	0	0	0	0	1	1	0	2	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 6. Patients' clinical data set for validation

Figure 4 shows the whole inference process and final inference result for the 2nd patient's data set.

(a) Dialog window

(b) Inference result (CLASS==1; psoriasis)

Figure 4. Inference result of SEES by using a knowledge base for dermatology

The dialog window shows the variable (IF conditions) and their translated sentence in the same time to elicit the user's correct response. This dialog window works until the final inference result was fired (Figure 4(b)).

4. Conclusion

In this study, we suggested an automatic expert systems construction and maintaining mechanism. The proposed mechanism consisted of the five main components: Library, Knowledge Elicitation, ES Generator, Knowledge Expresser, and Inference Engine. Our mechanism was based on machine learning, relational database, and traditional backward

inference algorithm, which were mainly aimed at expand the adaptability, expandability, and reusability of knowledge base. It is expected that our proposed expert system construction mechanism and expert system shell will have a significant impact on the research domain related to self-evolving expert system. Then, further research topics still remains. First, this expert system shell should be improved as an Internet-based system to support the Web-based user's decision-making. Second, other AI (artificial intelligence) technologies (such as fuzzy logic, neural networks, rough set, and etc.) may improve the inference ability of our expert system shell.
