

Inverse tunneling magnetoresistance in nanaoscale magnetic tunnel Junctions

KIM Tae-Suk

서울대학교 물리학과

We report on our theoretical study of the inverse TMR effect in the spin polarized transport through a narrow channel. In the weak tunneling limit, we find the ordinary positive TMR. The TMR changes its sign as the transmission probability becomes large close to a unity. Our results might be relevant to the magnetic tunnel junction with a pinhole or a quantum point contact.
