

Session III-2

## Molecular Epidemiological Study on Environmental and Genetic Risk Factors of Pediatric Cancer in Korea\*

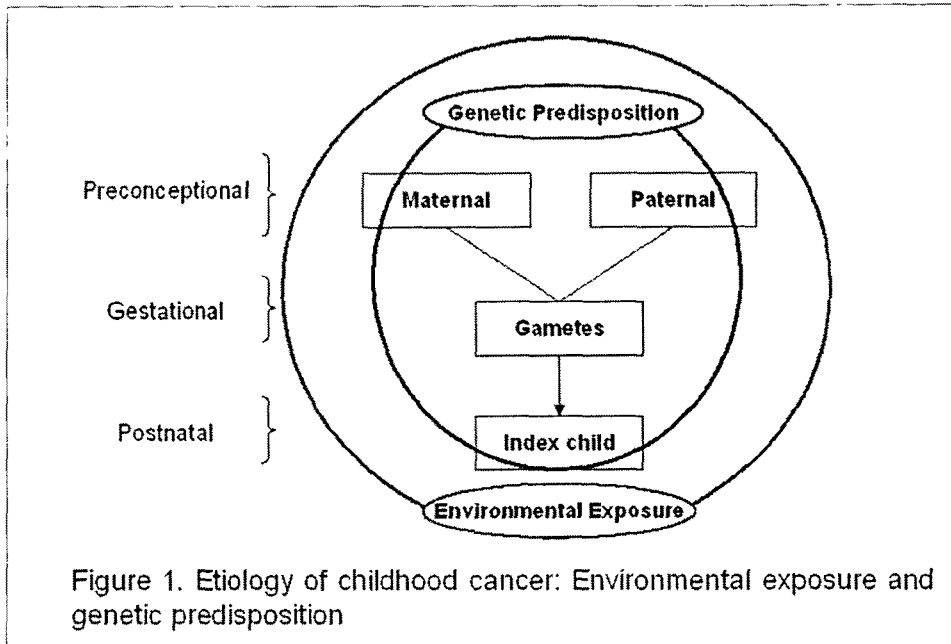

Kyoung-Mu Lee, Yoon-Ok Ahn, Daehee Kang, Moon-Ho Chung

Mol. Epi. Lab., Dept. Preventive Medicine,  
Seoul National University College of Medicine

\*funded by Korea Electrotechnology Research Institute, Changwon,  
Korea (2003-2006)

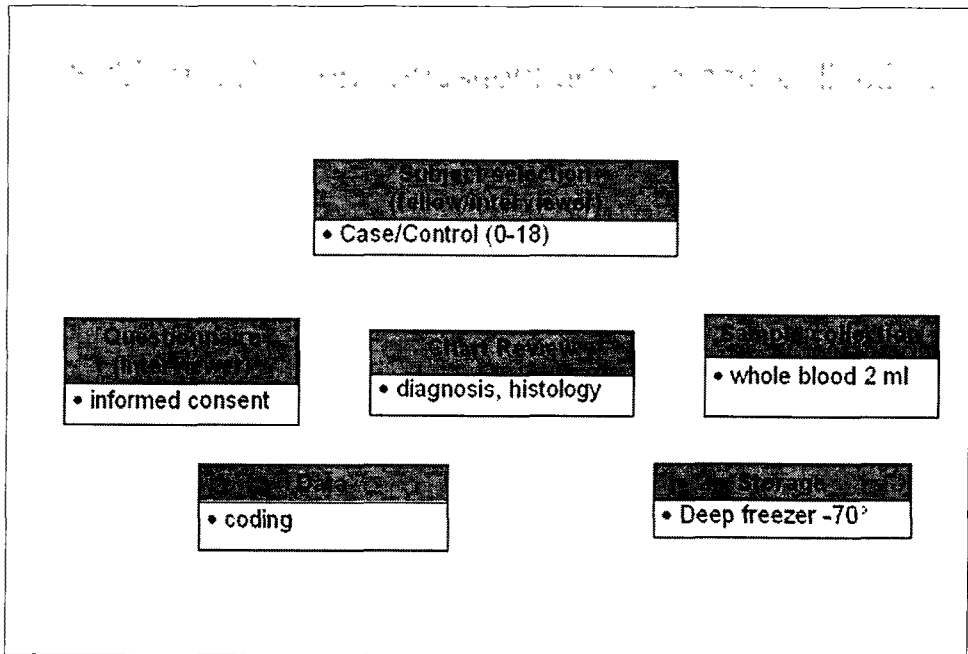

### Backgrounds

- second most frequent cause of death among infants or children aged 1 or more (cf. first one is accident and poisoning)
- cured childhood cancer cases need continuous health care
- etiology of childhood cancer remains to be elucidated
- ethnic diversity in genetic composition and environmental exposure warrants epidemiological study on childhood cancer in Korean population

## Objectives

- to evaluate the association between environmental factors and childhood cancer
- to evaluate the association between *CYP1A1* haplotype and childhood cancer
- to evaluate the interaction between parental smoking and *CYP1A1* haplotype on the development of childhood cancer

## Subjects (Arp/2003~May/2005)

- Cases (n=284)
  - recruited from the Department of Pediatrics in SNUH, SMC and AMC
  - leukemia (63%, n=178), brain tumor (22%, n=62) and lymphoma (16%, n=44)
  - age: 0-18
- Controls (n=298)
  - non-cancer controls (acute gastroenteritis (11%), hernia (10%), pneumonia (8%), LCP (5%), fracture, infectious diseases etc.)
  - recruited from SNUH, SMC, and Borame Hospital
  - age: 0-18
- Informed consent (reviewed by IRB of each hospital)

Table 1. Age distribution of subjects

Age	Leukemia	Brain tumor	Lymphoma	All cases	Controls
<1	12 (5)	2 (3)	2 (5)	13 (5)	39 (13)
1~4	59 (33)	20 (32)	10 (23)	89 (31)	125 (42)
5~9	55 (31)	19 (31)	15 (34)	89 (31)	78 (26)
10~14	48 (27)	17 (27)	15 (34)	80 (28)	50 (17)
15+	7 (4)	4 (6)	2 (5)	13 (5)	6 (2)
Total	178 (100)	62 (100)	44 (100)	284 (100)	298 (100)

## Histology of childhood cancer

- Leukemia
  - acute lymphoblastic leukemia (ALL) (66%)
  - acute myeloid leukemia (AML) (21%)
  - acute biphenotypic leukemia (9%)
- Brain tumor
  - medulloblastoma (40%)
  - germ cell tumor (26%)
  - primitive neuroectodermal tumor (21%)
- Lymphoma
  - B-cell (including Burkitt's lymphoma) (65%), T-cell (23%), and Hodgkin's disease (12%)

## Questionnaire

- interview with mother
- collected information
  - child: gender, birth order, birth weight, duration of breast feeding
  - farther & mother: education, smoking status & habit, alcohol consumption, occupation one year before the birth of the child
  - mother: medication of supplements during pregnancy, oral contraceptives
  - others: family history of cancer, family income, distance to transmission line, electric appliances at home (duration and frequency of the use), pesticide use, history of hospitalization of the child for 3 days or more

## Selection of SNPs in *CYP1A1*

- *CYP1A1*
  - Phase I enzyme: activation of PAHs
- SNP searching
  - SNP500Cancer/JSNP/NCBI SNP database
  - minor allele frequency > 10%
  - 10 locus
- 5 tagSNPs selected from 48 genotype data
  - min RSQ > 0.98

Table 2. Selected haplotype tagging SNP of *CYP1A1* with minor allele frequency more than 10%

No.	rs#	Locus
1	rs2472299	5'-region
2	-	5'-region
3	rs1048943	exon7
4	rs4646903	3'-region
5	rs2198843	3'-region

TagSNPs ver. 2: <http://www-rcf.usc.edu/~stram/tagSNPs.html>

## Single base extension assay

- PCR
  - PTC-225 Thermal cycler (MJ Research, MA)
- Primer extension
  - ABI 3800 DNA analyzer (ABI, USA)
- Quality Control
  - 5\*5 QC samples
  - 124/125=99% concordance rate

## Statistical Analysis

- frequency matching for sex and age (SAS proc surveyselect)
  - age: 0, 1-2, 3-4, 5-6, 7-8, 9-10, 11-12, 13-14, \_15
  - Leukemia: 166/166; Brain tumor: 62/62, Lymphoma: 44/44
- multiple logistic regression: OR (95% CI)
  - adjusted for age of child, father's education, and birth weight
- CYP1A1 haplotype estimation
  - Bayesian method: PHASE ver. 2.0.2
- diplotype analysis: multiple logistic regression

## Results

Table 3. Characteristic of childhood leukemia and controls

		Cases	Controls	P-value/ OR (95% CI)
sex, N (%)	male	103 (62.1)	103 (62.1)	1.00
	female	63 (37.9)	63 (37.9)	
age, mean ( $\pm$ SD)		7.00 ( $\pm$ 4.32)	7.11 ( $\pm$ 4.39)	0.82
birth weight (kg), mean ( $\pm$ SD)		3.38 ( $\pm$ 0.46)	3.18 ( $\pm$ 0.53)	<0.01
	<3.25	62 (37.4)	96 (57.8)	1.0 (ref.)
	3.25~3.7	55 (33.1)	46 (27.7)	1.9 (0.12-3.07)
	3.7 $\pm$	49 (29.5)	24 (14.5)	<b>3.2 (1.76-5.67)</b>
	<i>p-for trend</i>			<b>&lt;0.01</b>

Table 4. Medicine during pregnancy and childhood leukemia

		Case	Controls	OR (95% CI)*
		N (%)	N (%)	
iron supplements	no	81 (50.3)	86 (52.4)	1.00 (ref.)
	yes	80 (47.6)	78 (47.6)	1.1 (0.70-1.74)
medicine during pregnancy	no	151 (93.8)	161 (98.2)	1.00 (ref.)
	yes	10 (6.2)	3 (1.8)	<b>4.6 (1.19-17.7)</b>

\*adjusted for age of child, father's education, and birth weight

Table 5. Paternal smoking and childhood leukemia

		Cases N (%)	Controls N (%)	OR (95% CI)*
Paternal smoking status				
	400≤cigarettes	34 (10.5)	42 (25.5)	
	>400 cigarettes	132 (89.5)	123 (74.5)	1.3 (0.73-2.26)
Paternal smoking at home				
	no	89 (53.9)	106 (65.8)	
	yes	76 (46.1)	55 (34.2)	<b>1.7 (1.04-2.66)</b>
Paternal smoking at home at the presence of child				
	no	127 (77.0)	135 (83.9)	
	yes	38 (23.0)	26 (16.2)	1.5 (0.83-2.69)

\*adjusted for age of child, father's education, and birth weight

Table 6. *CYP1A1* haplotype distributions in childhood brain tumor cases and control subjects

Haplotype <sup>a</sup>	Brain tumor		Controls		P-value ( $\chi^2$ -test)
	N	%	N	%	
TGATG	37	30.8	36	30.0	0.20
CAGCC	26	21.7	34	28.3	
CGATG	21	17.5	16	13.3	
CGACC	12	10.0	20	16.7	
CGATC	19	15.8	9	7.5	
Others	5	3.3	5	4.2	
Total	120	100	120	100	

<sup>a</sup>estimated by Bayesian method using PHASE ver. 2.0.2; composed of four polymorphic sites: rs2472299 (C>T), rs4646903 (T>C), rs2198843 (C>G), and -9893G>A

Table 7. Interactive effect between paternal smoking and *CYP1A1* diplotypes and in childhood leukemia cases and control subjects

		CGACC containing diplotypes	Other diplotypes*	OR (95% CI) <sup>†</sup>
All		34/47 <sup>‡</sup>	123/116	1.5 (0.68-2.52)

## Summary

- birth weight & childhood leukemia (p-for trend<0.01)
- medication during conception & childhood leukemia (OR=4.6)
- Paternal smoking at home & childhood leukemia (OR=1.7)
- Effect of genetic polymorphisms of *CYP1A1* was modified by the paternal smoking status & habit in a dose-response manner
