*Pseudomonas putida* can catabolize many compounds such as vanillin, limonene, mandelate, camphor, adamantanone, bromoxynil, and styrene, so that its metabolic pathways are studied well<sup>1)</sup>. However, all of them belong to non-peptides. There are lots of bio-active peptides such as hormones. In addition to organic compounds, *P. putida* produces many peptides. We profiled 25 peptides contained in it using LC/MS/MS analysis. They are reported here.
