Soft Tissue and Esthetic Considerations in Implant Therapy

Dr. Atsuo Uematsu, DDS, PhD

Uematsu Dental Office in Yokohama, Kanagawa, Japan

Insufficient hard and soft tissue height and width can be a repercussion of tooth loss or a result of postoperative healing following implant surgery. Insufficient bone can preclude proper implant positioning, while inadequately treated soft tissue will not exhibit a gingival appearance similar to that of the adjacent teeth. If hard and soft tissue discrepancies are not corrected by regenerative techniques, the replaced appears long or over-bulked gingivally. In order to create hard and soft tissue harmony, an understanding of the biological variables and periodontal implications is necessary.

주요 학력 및 경력 :

Visiting Assistant Professor of Periodontology, Kanagawa Dental College

Director, Society of Japan Clinical Dentistry in Tokyo

Director, Uematsu Dental Office

PhD, Department of Oral Medicine, Division of Periodontology, Kanagawa Dental College

DDS, Kanagawa Dental College
