

[초IT-01] Review of the Globular Cluster works for the last 40 years

M S Chun
Yonsei University

Globular clusters, which are probably the oldest objects in the Galaxy, are usually believed to be internally homogeneous, with abundances that reflect those of the gas from which they formed. However this belief is turning out to be wrong through the research works that have been done for the last 40 years.

In this invited talk, I will review some of observational evidences for the inhomogeneities of globular clusters in the last half century.
