# 變斷面 連續보의 影響線 解法

## A Solution of the Influence Line of continuous beams with Variable cross Section

부산대 학교 土木工學科

專任講師 張炳淳\*

### Abstract

when one is designing a continuous bridge with variable cross sections, it is very troublesome to integrate explicitly load terms and various factor under consideration so that it has different moment of inertia at each cross section. In this paper to obtain the influence line of a arbitrary-span continuous beam with variable cross sections, the value of some particular function due to a load at any point can be carried out by numerical integration instead of definite integral.

The ordinate of the influence line equals the product of the magnitude of the final moment at each support due to unit moment at any support and the load terms due to unit load, measured at the point of application of the load.

It is concluded that this method can be easily used to design continuous bridges with arbitrary cross sections.

### 1. 緒 論

變斷面 連續橋梁을 設計하자면 보의 斷面二次 모멘트( $I(x)$ )가 一定하지 않아 荷重項이나 變斷面 理論式의 各 係數를 定積分으로 求하기가 매우 힘들어, 通常 等斷面 連續보로 보아 設計하고 支點에 현치를 붙여 支點補強을 하든지, 變斷面의 各 係數를 求하기 위한 圖表를 利用하는 경우가 大部分이다. 變斷面을 等斷面으로 보아 設計하여 支點에 현치를 붙이면 현치때문에 設計時의 휨모멘트보다 상당히 더 큰 휨모멘트를 부담한다. 또 變斷面의 諸 係數를 圖表를 利用하여 求하자면 變斷面의  $I(x)$ 와 圖表의  $I(x)$ 가

서로 一致하지 않는 경우가 많다. 本 論文은 任意徑間의 變斷面 連續보의 影響線을 修正모멘트分配法<sup>8)</sup>을 利用하여 計算하는 方法을 整理한 것이다.

### 2. 變斷面 連續보의 解析

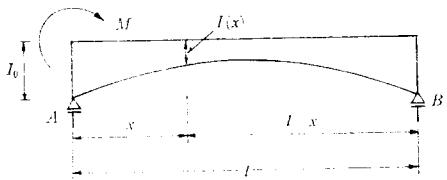

#### 2—1 양단한지인 變斷面보의 一端에 모멘트 $M$ 가 作用할때 처짐각 計算

$$I(x) = I_0 \cdot f(x)$$

$$\theta_A = \frac{M}{EI^2} \int_0^l \frac{(l-x)^2}{I(x)} \cdot dx$$

$$\theta_B = \frac{-M}{EI^2} \int_0^l \frac{x(l-x)}{I(x)} \cdot dx$$

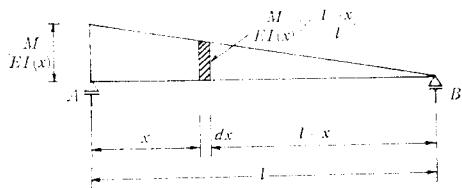

\* 土木技術士(構造)

라고 놓으면

$$\theta_A = -\frac{\gamma_{A2}}{E} \cdot M, \quad \theta_B = \frac{\gamma_{B2}}{E} \cdot M$$

로 表示된다. “Maxwell”의 법칙에 의하여  $\gamma_{A2} = \gamma_{B1}$  이고  $\gamma = \gamma_{A2} = \gamma_{B2}$ 로 表示키로 한다.

[그림 1]

여기서

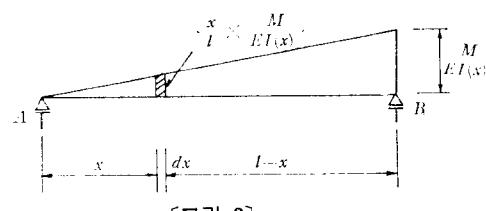

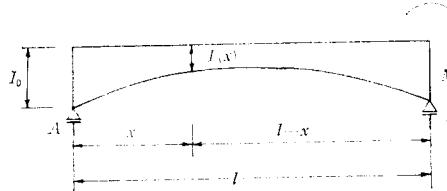

$$\gamma_{A1} = \frac{1}{l^2} \times \int_0^l \frac{(l-x)^2}{I(x)} \cdot dx,$$

$$\gamma_{B1} = \frac{1}{l^2} \int_0^l \frac{x(l-x)}{I(x)} \cdot dx$$

라고 놓으면

$$\theta_A = \frac{\gamma_{A1}}{E} \cdot M, \quad \theta_B = -\frac{\gamma_{B1}}{E} \cdot M$$

로 表示할 수 있다.

[그림 2]

$$I(x) = I_0 \cdot f(x)$$

$$\theta_A = -\frac{M}{El^2} \int_0^l \frac{x(l-x)}{I(x)} \cdot dx,$$

$$\theta_B = \frac{M}{El^2} \int_0^l \frac{x^2}{I(x)} \cdot dx$$

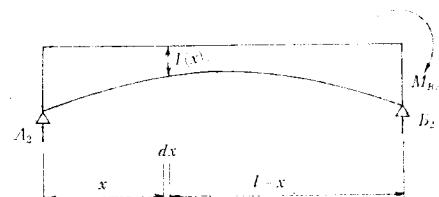

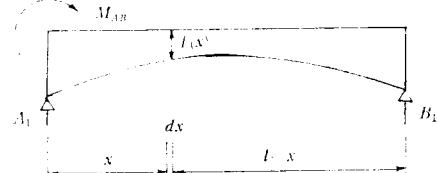

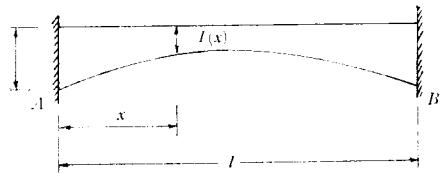

여기서

$$\gamma_{A2} = \frac{1}{l^2} \int_0^l \frac{x(l-x)}{I(x)} \cdot dx,$$

$$\gamma_{B2} = \frac{1}{l^2} \int_0^l \frac{x^2}{I(x)} \cdot dx$$

## 2-2 端回轉과 端모멘트 關係

### (1) 양단구속의 變斷面보

[그림 3]

$$\theta_{A1} = \frac{\gamma_{A1}}{E} \times M_{AB}, \quad \theta_{B1} = -\frac{\gamma}{E} \times M_{AB}$$

$$\theta_{A2} = \frac{\gamma}{E} M_{BA}, \quad \theta_{B2} = -\frac{\gamma_{B2}}{E} M_{BA}$$

$$\theta_A = \theta_{A1} + \theta_{A2} = \frac{\gamma_{A1}}{E} \times M_{AB} - \frac{\gamma}{E} \times M_{BA} \quad \dots \dots \dots (1)$$

$$\theta_B = \theta_{B1} + \theta_{B2} = -\frac{\gamma}{E} \times M_{AB} + \frac{\gamma_{B2}}{E} \times M_{BA} \quad \dots \dots \dots (2)$$

(1), (2)式을 연립으로 풀면 다음과 같이 表示된다.

$$M_{AB} = \frac{E \cdot \gamma_{B2} \cdot \theta_A + E \cdot \gamma \cdot \theta_B}{\gamma_{A1} \cdot \gamma_{B2} - \gamma^2} \quad \dots \dots \dots (3)$$

$$M_{BA} = \frac{E \cdot \gamma \cdot \theta_A + E \cdot \gamma_{A1} \cdot \theta_B}{\gamma_{A1} \cdot \gamma_{B2} - \gamma^2} \quad \dots \dots \dots (3)$$

여기서

$$\begin{aligned} \frac{\gamma_{B2}}{\gamma_{A1} \times \gamma_{B2} - \gamma^2} &= a_1 \\ \frac{\gamma}{\gamma_{A1} \times \gamma_{B2} - \gamma^2} &= b \\ \frac{\gamma_{A1}}{\gamma_{A1} \times \gamma_{B2} - \gamma^2} &= a_2 \end{aligned} \quad \dots \dots \dots (4)$$

라 놓으면 (3)式은 다음과 같이 表示된다.

$$M_{AB} = E(a_1 \theta_A + b \theta_B) \quad \dots \dots \dots (5)$$

$$M_{BA} = E(b \theta_A + a_2 \theta_B) \quad \dots \dots \dots (6)$$

(2) 일단구속, 타단한지의 變斷面보

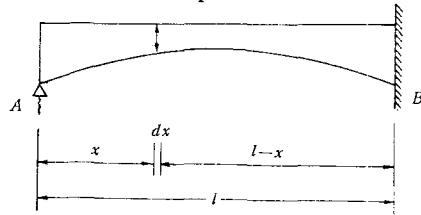

양단구속 變斷面보에서  $M_{AB}=0$  일 경우다.

$$M_{AB} = E(a_1 \theta_A + b \theta_B) = 0$$

$$\therefore \theta_A = -\frac{b}{a_1} \theta_B \quad \dots \dots \dots (7)$$

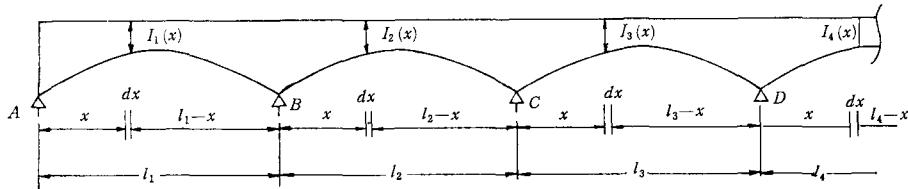

(7)式을 (6)式에 代入하고 정리하면 다음과 같다

$$M_{BA} = E(a_2 - \frac{b_1^2}{a_1}) \cdot \theta_B \quad \dots \dots \dots (8)$$

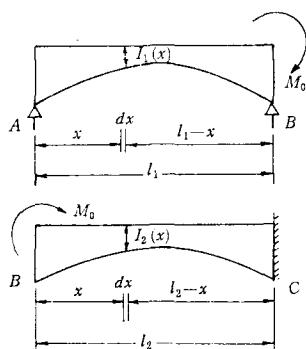

[그림 4]

### 2-3 變斷面 連練보의 모멘트分配率 計算

[그림 5]

#### (1) 모멘트分配率( $\mu_{BA}, \mu_{BC}$ )計算

[그림 6]

$$M_{BA} = E(a_{21} - \frac{b_1^2}{a_{11}}) \cdot \theta_B \quad \dots \dots \dots (9)$$

$$M_{BC} = E(a_{12}\theta_B + b_2\theta_C) \quad \dots \dots \dots (10)$$

(계수  $a$ 의 2번째 첨자 및 계수  $b$ 의 첫번째 첨자는 스펜을 表示함)

절점 B에 작용하고 있는 모멘트  $M_0$  解除 이 때 C點은 固定상태를 維持해야 하므로  $\theta_C=0$  이다.

$$\therefore M_0 = M_{BA} + M_{BC} = E(a_{12} + a_{21} - \frac{b_1^2}{a_{11}}) \cdot \theta_B$$

$$\therefore \theta_B = \frac{M_0}{E(a_{12} + a_{21} - \frac{b_1^2}{a_{11}})} \quad \dots \dots \dots (11)$$

(11)式을 (9), (10)式에 代入하고 정리하면 다음과 같다.

$$M_{BA} = \frac{(a_{21} - \frac{b_1^2}{a_{11}})}{(a_{12} + a_{21} - \frac{b_1^2}{a_{11}})} \times M_0 = \mu_{BA} \cdot M_0$$

$$M_{BC} = \frac{a_{12}}{(a_{12} + a_{21} - \frac{b_1^2}{a_{11}})} \times M_0 = \mu_{BC} \cdot M_0$$

$$\therefore \mu_{BA} = \frac{a_{21} - \frac{b_1^2}{a_{11}}}{a_{12} + a_{21} - \frac{b_1^2}{a_{11}}} \quad \dots \dots \dots (12)$$

$$\mu_{BC} = \frac{a_{12}}{a_{12} + a_{21} - \frac{b_1^2}{a_{11}}}$$

#### (2) 모멘트分配率( $\mu_{CB}, \mu_{CD}$ )計算

$$M_{CB} = E(b_2\theta_B + a_{22}\theta_C) \quad \dots \dots \dots (13)$$

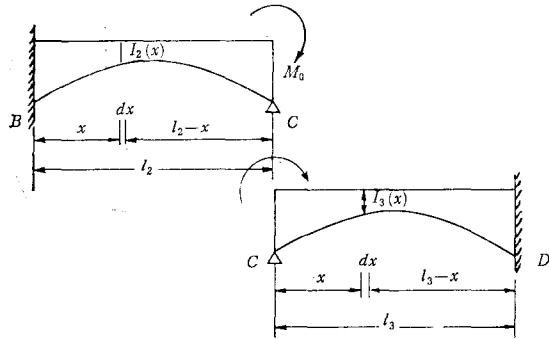

$$M_{CD} = E(a_{13}\theta_C + b_3\theta_D) \quad \dots \dots \dots (14)$$

절점 C의 구속해제 이 때 B點과 D點은 고정상태를 유지해야 하므로  $\theta_B = \theta_D = 0$  이다.

$$M_0 = M_{CB} + M_{CD} = E(a_{22} + a_{13}) \cdot \theta_C$$

$$\therefore \theta_C = \frac{M_0}{E(a_{22} + a_{13})} \quad \dots \dots \dots (15)$$

(15)式을 (13), (14)式에 代入하고 정리하면 다음과 같다.

[그림 7]

$$\begin{aligned} M_{CB} &= \frac{a_{22}}{a_{22} + a_{13}} \times M_0 = \mu_{CB} \cdot M_0 \\ M_{CD} &= \frac{a_{13}}{a_{22} + a_{13}} \times M_0 = \mu_{CD} \cdot M_0 \\ \therefore \quad \mu_{CB} &= \left[ \frac{a_{22}}{a_{22} + a_{13}} \right] \\ \mu_{CD} &= \left[ \frac{a_{13}}{a_{22} + a_{13}} \right] \end{aligned} \quad (16)$$

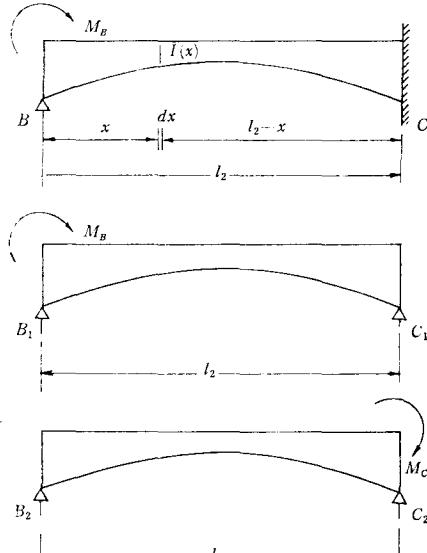

## 2-4 變斷面보의 傳達率 計算

(1) [그림 5]에서  $C_{BC}$  計算

$$\begin{aligned} \theta_{B1} &= \frac{M_B}{EI_2^2} \times \int_0^{l_2} \frac{(l_2-x)^2}{I_2(x)} dx \\ \theta_{C1} &= -\frac{M_B}{EI_2} \int_0^{l_2} \frac{x(l_2-x)}{I_2(x)} dx \\ \theta_{B2} &= -\frac{M_{CB}}{EI_2^2} \int_0^{l_2} \frac{x(l_2-x)}{I_2(x)} \cdot dx \\ \theta_{C2} &= -\frac{M_{CB}}{EI_2^2} \int_0^{l_2} \frac{x^2}{I_2(x)} \cdot dx \\ \theta_C &= \theta_{C1} + \theta_{C2} = 0 \\ \therefore \quad -\frac{M_B}{EI_2} \int_0^{l_2} \frac{x(l_2-x)}{I_2(x)} dx + & \\ -\frac{M_{CB}}{EI_2^2} \int_0^{l_2} \frac{x^2}{I_2(x)} dx &= 0 \\ M_{CB} &= \frac{\int_0^{l_2} \frac{x(l_2-x)}{I_2(x)} dx}{\int_0^{l_2} \frac{x^2}{I_2(x)} dx} \times M_B \\ &= \frac{\gamma_2}{\gamma_{B22}} \times M_B \\ \therefore \quad C_{BC} &= \frac{\gamma_2}{\gamma_{B22}} \end{aligned} \quad (17)$$

(2) [그림 5]에서 傳達率( $C_{CB}$ ) 計算

傳達率  $C_{BC}$  와 같은 수법으로 定理하면 다음과 같다.

[그림 8]

$$C_{CB} = \frac{\gamma_2}{\gamma_{A12}} \quad (18)$$

## 2-5 變斷面보의 荷重項 計算

(1) 1端固定 他端한자인 變斷面보에 單位荷重作用時 荷重項

스판  $l$  를  $n$  等分하면  $\Delta l = \frac{l}{n}$  이고 單位荷重作用位置는  $j$  번째이다.

$M_0$ ; 等斷面 單純보의 힘모멘트

$$\theta_{A1} = \frac{1}{EI} \sum_{j=1}^n \left\{ \frac{M_{0j}}{I_j} \cdot \Delta l^2 (n-j) \right\}$$

$$\theta_{B1} = -\frac{1}{EI} \sum_{j=1}^n \left\{ \frac{M_{0j}}{I_j} \Delta l^2 \cdot j \right\}$$

$$\theta_{A2} = -\frac{\gamma}{E} M_{BA}$$

$$\theta_{B2} = -\frac{\gamma_{B2}}{E} M_{BA}$$

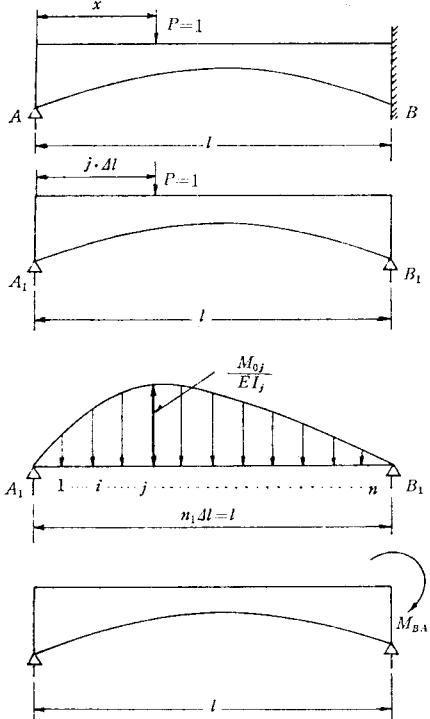

$$\theta_B = \theta_{B1} + \theta_{B2} = 0$$

$$\therefore -\frac{1}{EI} \sum_{j=1}^n \left\{ \frac{M_{0j}}{I_j} \Delta l^2 \cdot j \right\} + \frac{\gamma_{B2}}{E} M_{BA} = 0$$

$$M_{BA} = \frac{1}{l \times \gamma_{B2}} \times \sum_{j=1}^n \left\{ \frac{M_{0j}}{I_j} \Delta l^2 \cdot j \right\} \quad (19)$$

(2) 양단고정인 變斷面보에 單位荷重作用時 荷重項 計算

$$\theta_{A1} = \frac{1}{EI} \times \sum_{j=1}^n \left\{ \frac{M_{0j}}{I_j} \Delta l^2 (n-j) \right\}$$

[그림 9]

$$\theta_{B1} = \frac{-1}{El^2} \times \sum_{j=1}^n \left\{ \frac{M_{0j}}{I_j} \Delta l^2 \cdot j \right\}$$

$$\theta_{A2} = -\frac{\gamma_{A1}}{E} M_A - \frac{\gamma}{E} M_B$$

$$\theta_{B2} = -\frac{\gamma}{E} M_A + \frac{\gamma_{B2}}{E} M_B$$

$A$  및  $B$  點은 고정이므로 회전각이 0이다.

$$\theta_A = \theta_{A1} + \theta_{A2} = 0$$

$$\therefore \quad -\frac{1}{El} \sum_{j=1}^n \left\{ \frac{M_{0j}}{I_j} \Delta l^2(n-j) \right\}$$

$$\theta_B = \theta_{B1} + \theta_{B2} = 0$$

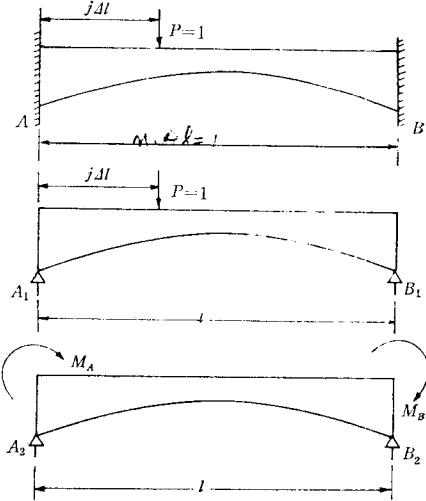

$$\therefore -\frac{1}{El} \sum_{j=1}^n \left\{ \frac{M_{0j}}{I_j} \Delta l^2 \cdot j \right\} = -\frac{\gamma}{E} M_A$$

$$+ \frac{\gamma_{B2}}{E} M_B = 0 \quad \dots \dots \dots \quad (21)$$

(20), (21) 式을 연립으로 풀면 다음과 같다.

$$M_A = -\frac{4l^2}{l} \sum_{j=1}^n \frac{M_{0j}}{I_j}$$

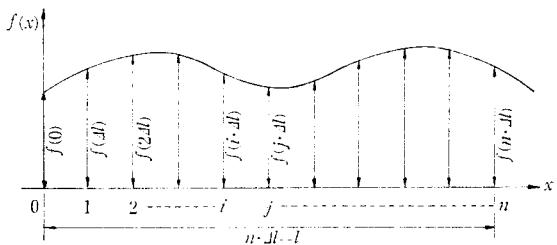

$$M_B = -\frac{4l^2}{l} \sum_{j=1}^n \frac{M_{0j}}{I_j}$$

[그림 10]

### 3. 變斷面 係數 $\gamma_{A1}, \gamma, \gamma_{B2}$ 的 數值積分

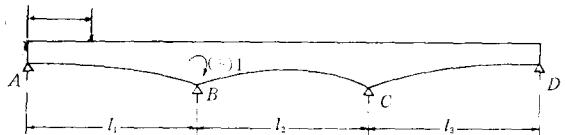

$$\gamma_{A1} = \frac{1}{l^2} \int_0^l \frac{(l-x)^2}{I(x)} dx, \quad \gamma = \frac{1}{l^2} \int_0^l \frac{x(l-x)}{I(x)} dx,$$

(그림 11)

$\gamma_{B2} = \frac{1}{t^2} \int_0^t \frac{x^2}{I(x)} dx$  을一般化 시키면  $\gamma = \frac{1}{t^2} \int_0^t f(x) \cdot dx$ 로 表示할 수 있다.

#### 4. 任意支點에 單位荷重項에 依한 變斷面連續보의 各 支點모멘트 計算

[그림 12]

		$k_{BC}$	$k_{CB}$	$C_{BC}$	$C_{CB}$	$\gamma_{BC}$	$\gamma_{CB}$
$PBA$	$PBC$	$C_{BC}$	$C_{CB}$	$\gamma_{BC}$	$\gamma_{CB}$		
$A$	$B$						
單位 $M$	$+1.00$	$0$					
		$(+k_{BC})$	$(-k_{CB})$				
		$k_{BC}^2 + k_{CB}^2$	$k_{BC}^2 + k_{CB}^2$				
		$k_{BC}^3 + k_{CB}^3$	$k_{BC}^3 + k_{CB}^3$				
$\sum C \cdot M$		$m_{11}$	$m_{12}$				
$\sum D \cdot M$		$m_{12} \times \frac{1}{C_{BC}}$	$m_{11} \times \frac{1}{C_{CB}}$				
$F \cdot M$		$m_{11} + m_{12} \times \frac{1}{C_{BC}}$	$m_{12} + m_{11} \times \frac{1}{C_{CB}}$				

[表 1]

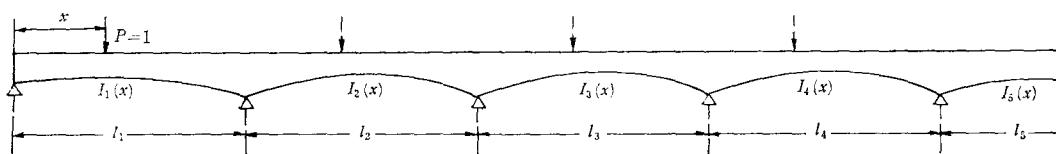

#### 5. $n$ 徑間 變斷面連續보의 影響線計算

##### (1) 變斷面係數( $\gamma_{A1}$ , $\gamma$ , $\gamma_{B2}$ )計算

첫 徑間, 둘째 徑間, ……  $n$  徑間 變斷面 보에 對해서 (24)式으로 數值積分한다.

##### (2) 變斷面보의 係數( $a_1$ , $a_2$ , $b$ )計算

變斷面보의 各各에 대하여 (4)式으로  $a_1$ ,  $a_2$ ,  $b$

[그림 13]

를 計算한다.

##### (3) 變斷面連續보의 모멘트分配率 및 傳達率 計算

各 節點에서 모멘트分配率은 (12)式(인접 점 중 一端은 헌지인 경우)과 (16)式(인접 점 둘 다 고정)으로 計算하고 각 보의 傳達率은 (17), (18)式으로 計算한다.

##### (4) 單位荷重作用時荷重項計算

一端固定 一端 헌지인 變斷面보의 荷重項은 (19)式으로 數值積分하여 求하고 양단固定인 變斷面보에서의 荷重項은 (22), (23)式으로 數值積分으로 計算한다.

##### (5) 單位荷重項에 依한 變斷面連續보의 支點모멘트 計算

任意支點에 單位荷重項( $M=(+1)$ )이 作用할 경우 [表 1]과 같이 傳達모멘트를 利用하여 各支點의 最終모멘트를 計算한다.

##### (6) 變斷面連續보의 影響線縱距 計算

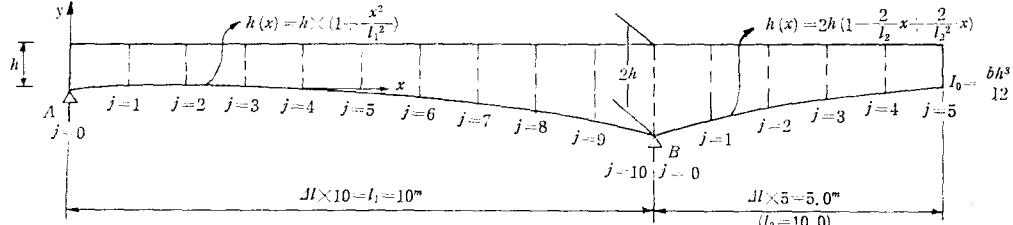

變斷面連續보의 任意支間에 單位荷重이  $1 \cdot \Delta l$ ,  $2 \cdot \Delta l \dots j \cdot \Delta l \dots (n-1) \cdot \Delta l$  位置에 作用할 때 各各의 경우에 對하여 荷重項을 計算하고 이 荷重項 和 單位 모멘트에 依한 變斷面連續보의 支點最終모멘트를 곱하면 그 값이 荷重載荷위치의 影響線縱距가 된다.

##### (7) 影響線縱距面積 計算

影響線縱距를 利用하여 數值積分으로 影響線面積을 計算한다.

#### 6. 計算例(三徑間 變斷面連續보)

##### (1) 構造

(3) 變斷面기係數決定

(i) 第一徑間보

$$\begin{aligned} \gamma_{A1} &= \frac{1}{3 \times 10^2} \times \frac{1}{I_0} \times [100+0+4 \\ &\quad \times (78.6179+37.8378+12.8002 \\ &\quad +2.7208+0.1686)+2 \times (56.8939+ \\ &\quad 23.0636+6.3606+0.9068)] = \frac{2.6768}{I_0} \end{aligned}$$

$$\begin{aligned} \gamma &= \frac{1}{3 \times 10^2 \times I_0} \times [0+0+4 \times (8.7353 \\ &\quad +16.2162+12.8002+6.3484+1.5178) \\ &\quad +2 \times (14.2235+15.3757+9.5408 \\ &\quad +3.6274)] = \frac{0.8934}{I_0} \end{aligned}$$

$$\begin{aligned} \gamma_{B2} &= \frac{1}{3 \times 10^2 \times I_0} \times [0+12.5000+4 \\ &\quad \times (0.9706+6.9498+12.8002+14.8130 \\ &\quad +13.6601)+2 \times (3.5559+10.2505 \\ &\quad +14.3113+14.5095)] = \frac{0.9818}{I_0} \end{aligned}$$

$$a_{11} = \frac{0.9818 \cdot I_0}{2.6768 \times 0.9818 - 0.8934^2} = 0.5365 \cdot I_0$$

$$b_1 = \frac{0.8934 \cdot I_0}{2.6768 \times 0.9818 - 0.8934^2} = 0.4882 \cdot I_0$$

$$a_{21} = \frac{2.6768 \cdot I_0}{2.6768 \times 0.9818 - 0.8934^2} = 1.4628 \cdot I_0$$

(ii) 第二徑間보

$$\begin{aligned} \gamma_{A1} &= \frac{1}{3 \times 10^2 \times I_0} \times [12.5000+0+4 \\ &\quad \times (18.3636+31.3921+25.0000+5.7659) \end{aligned}$$

$$+0.2267)+2 \times (25.4423+32.0028$$

$$+14.2235+1.5901)] = \frac{1.6067}{I_0}$$

$$\gamma = \frac{1}{3 \times 10^2 \times I_0} \times [0+0+4 \times (2.0404$$

$$+13.4538+25.0000+13.4538 \\ +2.0404)+2 \times (6.3606+21.3352+21.3352 \\ +6.3606)] = \frac{1.1158}{I_0}$$

$$\begin{aligned} \gamma_{B2} &= \frac{1}{3 \times 10^2 \times I_0} \times [0+12.5000+4 \\ &\quad \times (0.2267+5.7659+25.0000+31.3921 \\ &\quad +18.3636)+2 \times (1.5901+14.2235 \\ &\quad +32.0028+25.4423)] = \frac{1.6067}{I_0} \end{aligned}$$

$$a_{12} = \frac{1.6067 \cdot I_0}{1.6067 \times 1.6067 - 1.1158^2} = 1.2022 \cdot I_0$$

$$b_2 = \frac{1.1158 \cdot I_0}{1.6067 \times 1.6067 - 1.1158^2} = 0.8349 \cdot I_0$$

$$a_{22} = \frac{1.6067 \cdot I_0}{1.6067 \times 1.6067 - 1.1158^2} = 1.2022 \cdot I_0$$

(4) 모멘트分配率計算

$$\begin{aligned} \mu_{BA} &= \frac{a_{21} - \frac{b_1^2}{a_{11}}}{(a_{12} + a_{21} - \frac{b_1^2}{a_{11}})} \\ &= \frac{1.4628 - \frac{0.4882^2}{0.5365}}{1.2022 + 1.4628 - \frac{0.4882^2}{0.5365}} \\ &= 0.4587 \end{aligned}$$

$$\begin{aligned}\mu_{BC} &= \frac{a_{12}}{a_{12} + a_{21}} - \frac{b_1^2}{a_{11}} \\ &= \frac{1.2022}{1.2022 + 1.4628} - \frac{0.4882^2}{0.5365} \\ &= 0.5413\end{aligned}$$

(5) 傳達率 計算

$$C_{BA}=0$$

$$C_{BC} = \frac{\gamma_2}{\gamma_{B22}} = \frac{1.1158}{1.6067} = 0.6945$$

(6) B點에 單位모멘트에 依한 各 支點 F.M 計算

	A	B	C	D
$R_{BC}$	-0.3759	0.3759	-k <sub>u</sub>

## 7. 結論

本方法에 대한 論議에 따라 다음과 같은 結論을 낼 수 있겠다.

(1) 變斷面 連續橋梁을 設計하자면 보의 斷面 二次モメント  $I(x)$ 가 一定하지 않아 理論式의 諸係數를 定積分으로 求하기가 매우 힘든다. 本方法은 變斷面 보의 各 係數를 數值積分으로 간단히 表示하여, 여하한 보의 形狀이라도 쉽게 計算할 수 있다.

(2) 變斷面 連續보의 荷重項을 理論式으로 計算하기가 매우 곤란하나, 本方法은 單位荷重作用時 變斷面 보를 等斷面 보로 보아  $M_0$ 을 計算하여  $\frac{M_{0x}}{I(x)}$ 를 數值積分으로 간단하게 荷重項을 計算하였다.

(3)  $n$  徑間 變斷面 連續보의 影響線을 計算하기 為해 本方法은  $(n-1)$ 個의 支點 각각에 對하여 單位모멘트를 作用시켜  $(n-1)$ 個의 支點 最終모멘트를 計算하고, 任意스판의 任意位置에

單位荷重이 作用할 때의 荷重項을 計算하여, 이 荷重項과 單位모멘트에 依한 支點 最終모멘트를 穎하면 單位荷重 載荷位置의 影響線 縱距가 計算된다.

(4) 本方法은 變斷面 連續橋 設計時에 聯立 方程式을 取扱하지 않는다는 長點이 있다.
