ABSTRACT

The forest vegetation of Mt. Naejang, southwestern Korea were classified into ten associations in four alliances of one order by Z-M school method as follows:

Quercetalia serrato-mongolicae ord. nov.

Rhododendro-Pinion densiflorae all. nov.

Rhododendro mucronulati-Pinctum densiflorae Kim et Yim 1986

Acero-Quercion mongolicae all. nov.

Rhododendro-Quercetum mongolicac assoc. nov.

Carpinion laxiflorae Kim et Yim 1986

Quercetum variabilis Kim et Yim 1986

Carpinetum laxiflorae Kim et Yim 1986

Carpinetum tschonoskii Kim et Yim 1986

Daphniphyllum macropodium community

Quercus aliena-Carpinus tschonoskii community

Corno-Zelkovion serratae all. nov.

Corno-Linderctum erythrocarpac assoc. nov.

Torreyo-Zelkovetum serratae assoc. nov.

Acero-Zelkovetum serratae assoc. nov.

On the other hand, four groups and six subgroups were divided by the species association, and their groups and subgroups showed the coincidence with the alliances and associations, phytosociological units.

INTRODUCTION

Mt. Naejang national park area is largely covered with hornbeam (*Carpinus*) forest and oak (*Quercus*) forest but pine (*Pinus*) forest in disturbed area. Hornbeam forests have been recognized as a distinct forest vegetation in cool-temperate zone in Korea, that is, *Carpinus laxiflora* and *Carpinus tschonoskii* are character species in middle and southern part of cool-temperate zone, respectively (Uyeki, 1933; Yim, 1977b; Kim and Yim, 1986b). Mongolian oak

(*Quercus mongolica*) is widely distributed throughout southeastern Siberia, Mongolia, Manchuria and Korea (Miyawaki *et al.*, 1983) and has been also recognized as a dominant species in middle part of cool-temperate zone in Korea (Baek and Yim, 1983; Choi and Yim, 1984; Yim and Baik, 1985). Mongolian oak has been found in more cool area and more xeric area than those of hornbeam species (Yim, 1977b; Jang and Yim, 1985; Yim and Kim, 1985). Japanese red pine (*Pinus densiflora*) is usually found at disturbed area or rocky area.

Hornbeam forest, oak forest and pine forest are main communities in cool-temperate zone of Korea. However, these vegetations are not yet fully recognized in phytosociological and ecological viewpoints. To clarify these problems, the study on the forest vegetation of Mt. Naejang was carried out by the Zürich-Montpellier school method (Z-M method) and association analysis.

We thank Mr. Jae-Ki Ko for his assistances in the field works.

STUDY AREA

In Mt. Naejang area (ca. 75.8 km², 35°24'30"-35°31'15"N and 126°48'40"-126°56'20"E) there are two main peaks, Sinseonbong (763 m) of Naejang temple area and Backhagbong (722 m) of Backyang temple area (Fig. 1). The mountains chiefly formed from andesites, Kyeongsang volcanic rocks in the Cretaceous period, are characterized by steep slopes or rock ridges, thin soil layer and variation of stream water volume, especially in upper part. The soils of the

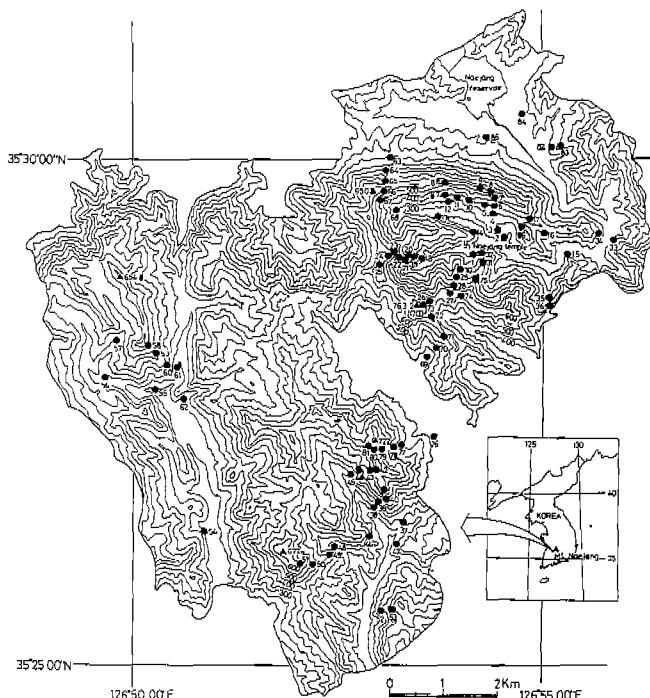

Fig. 1. Map showing the study sites. Arabian numerals: relevé numbers in Tables 2-9.

mountain show the variations of stony loam and stony sandy loam in the upper part, gravelly loam and gravelly sandy loam in lower part and sandy loam in flat land (Office of Rural Development, 1975).

For a long time, many trees had been repeatedly cut for the use of house building or fire wood. Herbaceous plants had also been grazed for domestic animals, collection of edible plants and shifting agriculture. However, before national park settlement in 1971, the forest has been preserved under laws of natural conservation.

Kira's warmth index 107.3°C · month (Yim and Kira, 1975), Thornthwaite's moisture index 53.9 (Yim and Kira, 1976), mean annual temperature 12.5 °C and mean annual precipitation 1263.9 mm (Fig.2) based on the data of Jeongju meteorological station, ca. 10 km northwest of the mountain were referred to the discussion.

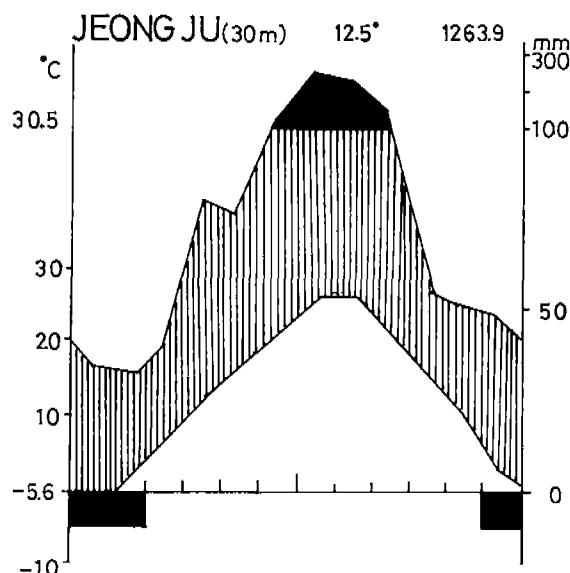

Fig. 2. Climate diagram of Jeongju near Mt. Naejang. The two curves chart monthly mean temperature (°C) and precipitation (mm); barring where the precipitation curve lies above the temperature curve presumably represents humid season and black area (mean monthly precipitation in excess of 100 mm) perhumid season, and black boxes indicate months with a mean daily minimum below 0°C, cold season. Additional information in the figure includes elevation, mean annual temperature, mean annual precipitation, mean daily temperature maximum of the warmest month, and mean daily temperature minimum of the coldest month.

MATERIALS AND METHODS

Vegetation survey. By the Z-M method the eighty six relevés were selected (Braun-Blanquet, 1964; Werger, 1974; Miyawaki *et al.*, 1981) during 1985-1987 (Fig.1). 10 m × 10 m (5 m × 5m, 15 m × 15 m or 20 m × 20 m on occasion) size quadrat in minimal area was set randomly

at every relevé. The dominance and sociability of vascular plant species and habitat conditions in each relevé were described. The plant name was recorded according to Lee (1979).

Tabulation. By tabular comparison method (Küchler, 1967; Shimwell, 1971; Mueller-Dombois and Ellenberg, 1974; Toyohara, 1977; Suzuki *et al.*, 1985) plant communities were classified. To determine the vegetational units of the forest, the communities classified were compared with those of other regions (Miyawaki *et al.*, 1983; Yim and Baik, 1985; Kim and Yim, 1986a).

Correlation analysis between species. Species associations were determined with the X^2 test by the use of a 2×2 contingency table (Shimwell, 1971; Kershaw, 1973; Krebs, 1978) and species constellation based on X^2 values was prepared by methods of Agnew (1961) and Kershaw (1964). The results of correlation analysis between species were compared with vegetational units classified by tabular comparison method.

RESULTS AND DISCUSSION

Hierarchy of Mt. Naejang forest vegetation. The forest vegetation of Mt. Naejang area was divided into eight associations in four alliances of one order and two communities and their associations were also subdivided into several subassociations as follows:

Quercetalia serrato-mongolicae ord. nov.

Rhododendro-Pinion densiflorae all. nov.

Rhododendro mucronulati-Pinetum densiflorae Kim et Yim 1986

Acero-Quercion mongolicae all. nov.

Rhododendro-Quercetum mongolicae assoc. nov.

Typical subassoc., *Rhododendron yedoense* var. *poukhanense* subassoc. and *Sasa borealis* subassoc.

Carpinetum laxiflorae Kim et Yim 1986

Quercetum variabilis Kim et Yim 1986

Typical subassoc. and *Sasa borealis* subassoc.

Carpinetum laxiflorae Kim et Yim 1986

Typical subassoc., *Hydrangea serrata* for. *acuminata* subassoc. and *Sasa borealis* subassoc.

Daphniphyllum macropodium community

Carpinetum tschonoskii Kim et Yim 1986

Typical subassoc. and *Sasa borealis* subassoc.

Quercus aliena-*Carpinus tschonoskii* community

Corno-Zelkovion serratae all. nov.

Corno-Linderetum erythrocarpae assoc. nov.

Hydrangea serrata for. *acuminata* subassoc. and *Sasa borealis* subassoc.

Torreyo-Zelkovetum serratae assoc. nov.

Typical subassoc., *Thea sinensis* facies and *Sasa borealis* subassoc.

Accro-Zelkovetum serratae assoc. nov.

Typical subassoc. and *Sasa borealis* subassoc.

In the above hierarchy system one new order, three new alliances and four new associations were found as marked with "nov." (Table 1).

Nature of various units. The character species of *Quercetalia serrato-mongolicae* ord. nov. are mentioned such as *Quercus mongolica*, *Quercus serrata*, *Viola acuminata*, *Fraxinus rhynchophylla*, *Smilax china*, *Disporum smilacinum*, *Prunus sargentii* and *Carex sieberostica*. *Quercus mongolica* and *Quercus serrata* were known as the species with a wide range of thermal distribution, Warmth index (WI) 18–111 in the former and WI 40–122 in the latter (Yim, 1977a) and the character species of cool-temperate deciduous broadleaf forest zone. *Pinus densiflora*, *Carpinus laxiflora*, *Carpinus tschonoskii*, *Zelkova serrata*, *Quercus variabilis* and *Quercus monolica* showed their characteristics of distributional range along the climatic, topographic and edaphic conditions in the mountain. This order is similar to *Quercetalia serrato-grosserratae* in Japan. However, the latter differs from the former in character species with *Quercus serrata*, *Prunus sargentii*, *Viburnum dilatatum*, *Castanea crenata*, *Pourthiae villosa*, *Corylus sieboldiana* and *Callicarpa japonica* (Miyawaki *et al.*, 1983).

Rhododendro-Pinion densiflorae all. nov. is characterized with *Pinus densiflora*, *Rhododendron yedoense* var. *poukhanense*, *Vaccinium oldhamii*, *Juniperus rigida* and *Rhus verniciflua* as in Mt. Seonun (Kim and Yim, 1986a). This alliance is similar to *Pinion densiflorae* Suz.-Tok. 1966 in Japan but differs in character species composition, having *Pinus densiflora*, *Vaccinium oldhamii*, *Juniperus rigida* and *Lyonia ovalifolia* var. *elliptica* as the character species (Miyawaki *et al.*, 1983). *Rhododendro mucronulati-Pinetum densiflorae* is included in this new alliance in the mountain.

The character species of *Acero-Quercion mongolicae* all. nov. include some species such as *Quercus mongolica*, *Artemisia keiskeana*, *Carex lanceolata*, *Viola dissecta* var. *chaerophylloides*, *Fraxinus sieboldiana* and *Acer pseudo-sieboldianum*. *Quercus mongolica* was known as character species of middle parts of cool-temperate deciduous broadleaf forest zone with WI 46–90 optimal range (Yim, 1977a). This species has been found at the more xeric-upper parts of the slope than in hornbeam species and usually accompanied with *Acer pseudo-sieboldianum* as in Mt. Seolag, Mt. Chiri and Mt. Gyeryong (Jang and Yim, 1985; Yim and Kim, 1985; Song, 1985). This alliance is distinguished from other alliances by the presence of *Quercus mongolica*, *Artemisia keiskeana*, *Carex lanceolata*, *Viola dissecta* var. *chaerophylloides*, *Fraxinus sieboldiana* and *Acer pseudo-sieboldianum* as character species. In the new alliance *Rhododendro-Quercetum mongolicae* is included in the mountain.

In *Carpinion laxiflorae* Kim et Yim 1986 *Carpinus laxiflora*, *Styrax obassia*, *Sapium japonicum*, *Euonymus sachalinensis*, *Acer pseudo-sieboldianum* var. *koreanum*, *Lindera obtusiloba* and *Styrax japonica* are observed as character species. *Carpinus laxiflora* was known as character species of southern and middle parts of cool-temperate deciduous broadleaf forest with optimal range of WI 76–89 (Yim and Kim, 1985) and found at middle and lower slopes of the mountain. *Carpinus laxiflora*, *Carpinus tschonoskii*, *Quercus variabilis* and *Quercus aliena* showed different ecological behaviors among them in climatic, topographic and edaphic conditions as in Mt. Seonun (Kim and Yim, 1986a). The alliance includes three associations, *Quercetum variabilis*,

Carpinetum laxiflorae and Carpinctum tschonoskii, and two communities, *Daphniphyllum macropodum* and *Quercus aliena*-*Carpinus tschonoskii* community.

In Corno-Zelkovion serratae all. nov., *Zelkova serrata*, *Staphylea bumalda*, *Zanthoxylum piperitum*, *Acer mono*, *Thalictrum acutaefolium*, *Oplismenus undulatifolius*, *Celtis sinensis*, *Cornus controversa* and *Lindera erythrocarpa* are determined as character species. They occur near the mountain stream and on the well drained stony slopes as in Mt. Seonun (Kim and Yim, 1986a). This alliance differs from Zelkovion-serratae Miyawaki et al. 1977 in Japan except *Zelkova serrata*. In the Japanese alliance *Zelkova serrata*, *Meliosma tenuis*, *Celtis jessoensis*, *Acer carpinifolium*, *Kerria japonica*, *Lindera obtusiloba*, *Cornus brachypoda*, *Ostrya japonica*, *Parabenzoin praecox*, *Philadelphus satsumi*, *Athyrium niponicum* and *Euonymus fortunei* are found as the character species (Miyawaki et al., 1983). In the new alliance three associations, Corno-Linderetum crythrocarpae, Torreyo-Zelkovetum serratae and Acero-Zelkovetum serratae are discriminated.

Plant associations.

Rhododendro mucronulati-Pinetum densiflorae Kim et Yim 1986 (Table 2).

Pinus densiflora, *Rhododendron mucronulatum*, *Milium effusum* and *Festuca ovina* as character species occur more abundantly at the lower parts of the mountain, disturbed and poor habitat such as hillock, exposed ridge and dry area. In the tree layer of the association *Quercus variabilis*, *Quercus serrata*, *Prunus sargentii*, *Juniperus rigida* and *Castanea crenata* are found as companion species with lower coverage and in shrub layer *Rhododendron mucronulatum*, *Rhododendron yedoense* var. *poukhanense*, *Lespedeza bicolor*, *Rosa multiflora*, *Symplocos chinensis* for. *pilosa* and *Stephanandra incisa* as shrubby species, *Quercus aliena*, *Quercus dentata*, *Styax japonica*, *Albizzia julibrissin*, *Rhus verniciflua*, *Corylus heterophylla* var. *thunbergii*, *Fraxinus rhynchophylla* and *Carpinus tschonoskii* as tree saplings. The herb layer is composed of some constant species such as *Milium effusum*, *Artemisia keiskeana*, *Festuca ovina*, *Smilax china*, *Carex lanceolata*, *Pteridium aquilinum* var. *latiusculum*, *Disporum smilacinum*, *Aster scaber*, *Melampyrum roseum*, *Agrimonia pilosa* and *Smilax nipponica*. *Lilium tsingtauense*, *Atractylodes japonica* and *Partrinia scabisaefolia* are rarely found. Similar floristic composition is also found in Mt. Seonun (Kim and Yim, 1986a). Therefore, the pine association of this mountain belongs to the *Rhododendro mucronulati-Pinetum densiflorae* Kim et Yim 1986.

Rhododendro-Quercetum mongolicae assoc. nov. (Table 3).

The character species, *Quercus mongolica*, *Rhododendron schlippenbachii*, *Melampyrum roseum* and *Ainsliaea acerifolia* occur on the upper parts of the slopes and somewhat xeric sites in the mountain as in Mt. Seolag, Mt. Chiri and Mt. Gyeryong (Yim and Baik, 1985; Jang and Yim, 1985; Song, 1985). The mongolian oak forest developed at elevations above 600 m in the mountain is proposed here as a new association, *Rhododendro-Quercetum mongolicae*, as a climatic climax. In the tree layer of the forest *Quercus variabilis*, *Fraxinus sieboldiana*, *Quercus serrata*, *Platycarya strobilacea*, *Carpinus laxiflora* and *Prunus sargentii* are found with companions in

Date of survey: Releve' No. 11-14; Aug. 4, 1985, No. 37,40; Aug. 7, 1985, No. 30; Aug. 5, 1985, No. 67; May 17, 1986.

Note: L; lower part of slope, M; middle part of slope, V; valley.

lower coverage. The shrub layer of 3 m height is chiefly composed of *Rhododendron schlippenbachii*. The herb layer is dominated by *Disporum smilacinum*, *Melampyrum roseum* and several sedges. This association include three subassociations:

- a. Typical subassociation without differential species.
- b. *Rhododendron yedoense* var. *poukhanense* subassociation with differential species, *Rhododendron yedoense* var. *poukhanense*.
- c. *Sasa borealis* subassociation with differential species, *Sasa borealis*.

Quercetum variabilis Kim et Yim 1986 (Table 4).

Character species: *Quercus variabilis*, *Lespedeza bicolor* and *Indigofera kirilowi*. They occur more abundantly on the sunny steep mountainside and xeric hillside. High constants are *Lespedeza bicolor*, *Indigofera kirilowi* and *Smilax china* after pioner species. This indicates that *Quercus variabilis* forests develope secondarily when the forests are destroyed by some causes. The forests are regarded as a topographic or edaphic climax. The character species of this association are the same as those in Mt. Seonun (Kim and Yim, 1986a). In the upper tree layer of *Quercus variabilis* forest of about 17 m tall and over 56 cm in dbh, *Quercus serrata*, *Platycarya strobilacea* and *Prunus sargentii* are observed in lower coverage. The lower tree layer is usually rather open, where *Carpinus laxiflora* is sometimes scattered. The shrub layer covered with *Lindera obtusiloba*, *Viburnum dilatatum* and *Acer pseudo-sieboldianum* and the herb layer is dominated by *Smilax china* and several sedges. There are two subassociations:

- a. Typical subassociation without differential species.
- b. *Sasa borealis* subassociation with differential species, *Sasa borealis*.

Carpinetum laxiflorae Kim et Yim 1986 (Table 5).

Carpinus laxiflora, *Viburnum dilatum*, *Symplocos chinensis* for. *pilosa* and *Rhus trichocarpa* are determined as character species. They occur on the middle parts of the slopes and somewhat mesic site of the mountain as in Mt. Chiri and Mt. Seonun (Jang and Yim, 1985; Kim and Yim, 1986a). *Carpinus laxiflora* forests developed at elevations 400 m–600 m may be a climatic climax in this mountain, considering its optimal range in thermal distribution (Yim, 1977a; 1977b). In the tree layer of *Carpinus laxiflora* with about 20 m tall and over 60 cm in dbh trees, companion tree species such as *Lindera erythrocarpa*, *Quercus serrata*, *Acer mono* and *Cornus controversa* are observed in low coverage. The shrub layer is dominated by *Lindera obtusiloba* and *Viburnum dilatum* of about 3 m height and the herb layer by *Sasa borealis* occurred at relatively mesic site. The association is subdivided into three subassociations by the combinations of the differential species:

- a. Typical subassociation without differential species.
- b. *Hydrangea serrata* for. *acuminata* subassociation with differential species, *Hydrangea serrata* for. *acuminata*.
- c. *Sasa borealis* subassociation with differential species, *Sasa borealis*.

Daphniphyllum macropodum community (Table 5).

The community was distinguished from others by *Daphniphyllum macropodum*, differential species. The species occurs more abundantly on the lower parts of the slopes and valley of Mt. Naejang, northern limit of evergreen broadleaf forest (Park, 1974). The presence of this species in this mountain is attributed to climatic fluctuation which favored the northern migration of southern evergreen forest species as case of *Camellia japonica* in Mt. Seonun (Kim and Yim, 1987).

Carpinetum tschonoskii Kim et Yim 1986 (Table 6).

Character species: *Carpinus tschonoskii*, *Acer pseudo-sieboldianum* var. *koreanum*, *Stephanandra incisa* and *Meliosma myriantha*. *Carpinus tschonoskii* as the character species for southern part of cool-temperate deciduous broadleaf forest zone in Korea (Uyeki, 1933) is overlapped in WI 47–121 of their thermal distribution range with *Carpinus laxiflora* (Yim, 1977a). However, the optimal range of two species apparently differs each other. The former occurs on more warm and more mesic sites than the latter (Jang and Yim, 1985; Kim and Yim, 1986a). The species are found almost at elevation below 400 m in the mountain as in Mt. Seonun (Kim and Yim, 1986a). The tree layer of the association is composed of *Carpinus tschonoskii* tree of 20 m over in height and over 70cm in dbh and companion tree species such as *Linder erythrocarpa*, *Prunus sargentii*, *Cornus controversa*, *Quercus serrata* and *Quercus aliena*. The shrub layer of 3 m high is covered with shrubby species of *Sapium japonicum*, *Stephanandra incisa* and *Lindera obtusiloba* and tree saplings of *Lindera erythrocarpa*, *Acer pseudo-sieboldianum* var. *koreanum* and *Fraxinus sieboldiana*. The herb layer is largely dominated by *Sasa borealis*. This association is subdivided into two subassociations by the differential species:

- Typical subassociation without differential species.
- Sasa borealis* subassociation with differential species, *Sasa borealis*.

Quercus aliena-Carpinus tschonoskii community (Table 6).

Differential species, *Quercus aliena* occurs more abundantly on the lower parts of the slope, valley and flatland. High constant species in this community are *Stephanandra incisa*, *Lindera obtusiloba* and *Oplismenus undulatifolius*.

Corno-Linderetum erythrocarpac assoc. nov. (Table 7).

Lindera erythrocarpa, *Cornus controversa*, *Arisaema amurense* and *Alangium platanifolium* var. *macrophyllum* as character species usually occur on the lower parts of the slope, ravines, shade and humid sites. Considering the distribution of these species, the association seems to be a topographic or edaphic climax. In the tree layer of this association *Lindera erythrocarpa* and *Cornus controversa* often become about 22 m tall and 30–40 cm in dbh and *Fraxinus rhynchophylla*, *Zelkova serrata* and *Sapium japonicum* are found as companion species. The shrub layer with *Alangium platanifolium* var. *macrophyllum*, *Viburnum dilatatum* and *Lindera obtusiloba* is usually scattered and the herb layer is dominated by *Sasa borealis*, *Oplismenus undulatifolius* and

Polysticum tripteron. This association is subdivided into two subassociations by the combination of the differential species:

- Hydrangea serrata* for. *acuminata* subassociation with differential species, *Hydrangea serrata* for. *acuminata* and *Polysticum tripteron*.
- Sasa borealis* subassociation with differential species, *Sasa borealis*.

Torreyo-Zelkovetum seratae assoc. nov. (Table 8).

Torreya nucifera, *Adenocaulon himalaicum* and *Disporum sessile* were determined as character species. *Torreya nucifera* of evergreen broadleaf tree occurs on the lower parts of the slope, which is the distributional northern limit of the species in Mt. Naejang (Park, 1974; Lee and Lee, 1974). The presence of this species in the mountain is attributed to climatic fluctuations which favored the northern migration of southern evergreen forest species as case of *Daphniphyllum macropodum* forest. The association is similar to Torreyo radicans-Zelkovetum serratae of Japan in a sense but different in character species composition except *Zelkova serrata* (Miyawaki et al., 1983). In the tree layer of the association *Torreya nucifera* trees of 17 m tall and over 70 cm in dbh, and companion tree species such as *Acer pseudo-sieboldianum* var. *koreanicum*, *Zelkova serrata* and *Cornus controversa* are found. The shrub layer is open, where *Trachelospermum asiaticum* var. *intermedium*, *Hedera rhombea*, *Orixa japonica* and saplings of maple tree are scattered, and the herb layer is covered with *Adenocaulon himalaicum*, *Disporum sessile* and *Sasa borealis*. This association is subdivided into three subassociations by the combinations of differential species:

- Typical subassociation without differential species.
- Thea sinensis* facies with differential species, *Thea sinensis*.
- Sasa borealis* subassociation with differential species, *Sasa borealis*.

Acero-Zelkovetum serratae assoc. nov. (Table 9).

Acer mono, *Polysticum tripteron*, *Hydrangea serrata* for. *acuminata* and *Celtis sinensis* are character species. They commonly occur on the lower parts of the slope and mesic stony sites, ravines. It means that the association is a topographic or edaphic climax in this mountain. In the tree layer of the association *Acer mono* and *Zelkova serrata* tree of 17 m tall and over 60 cm in dbh and companion tree species such as *Lindera erythrocarpa*, *Celtis sinensis*, *Cornus controversa* and *Acer pseudo-sieboldianum* var. *koreanicum* are found. The shrub layer with *Lindera obtusiloba* and saplings of *Lindera erythrocarpa* is usually rather open and the herb layer is dominated by *Oplismenus undulatifolius* and *Sasa borealis*. This association is subdivided into two subassociations by the combination of differential species:

- Typical subassociation without differential species.
- Sasa borealis* subassociation with differential species, *Sasa borealis*.

Species association. Chi-square tests of species association by 2 × 2 contingency table were

run with all species pairs for the thirty nine species, character species of associations found in classification. The positive correlations obtained were diagrammatically represented in the form of a two-dimensional arrangement of species, a species constellation (Fig. 3). From the constellation, four major groups of positively correlated species were recognized (shaded in Figure 3), which might be regarded as alliances. There are three intermediate species between four groups, *Fraxinus rhynchophylla*, *Smilax china* and *Quercus serrata*. This group might be regarded as one order, because the four groups are not completely independent from another. Some groups were divided into several subgroups, which might be recognized as an association:

Group 1. (upper left-hand side of the Figure 3): *Pinus densiflora*, *Juniperus rigida*, *Rhododendron yedoense* var. *poukhanense*, *Festuca ovina*, *Milium effusum* and *Rhododendron mucronulatum*.

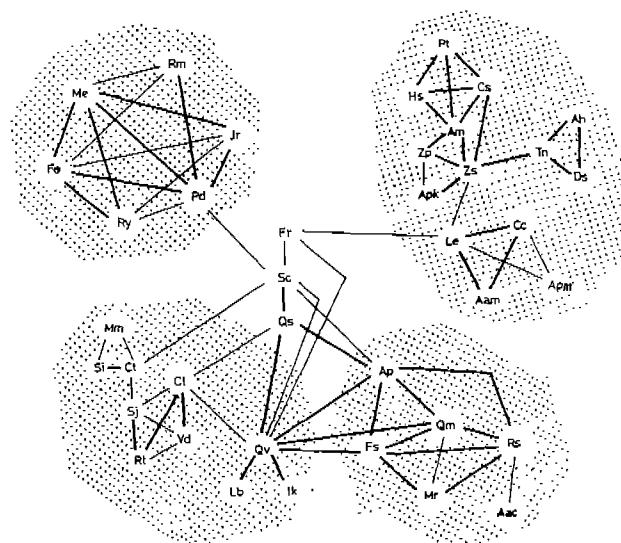

Fig. 3. Species constellation showing positive correlations between 39 species from forests of Mt. Naejang. Single line represents $5\% >p > 1\%$, double $p < 1\%$ for chi-square values. Aac: *Ainsliaea acerifolia*, Aam: *Arisaema amurense*, Ah: *Adenocaulon himalaicum*, Am: *Acer mono*, Ap: *Acer pseudo-sieboldianum*, Apk: *Acer pseudo-sieboldianum* var. *koreanum*, Apm: *Alangium platanifolium* var. *macrophyllum*, Cc: *Cornus controversa*, Cl: *Carpinus laxiflora*, Cs: *Celtis sinensis*, Ct: *Carpinus tschonoskii*, Ds: *Disporum sessile*, Fo: *Festuca ovina*, Fr: *Fraxinus rhynchophylla*, Fs: *Fraxinus sieboldiana*, Hs: *Hydrangea serrata* for. *acuminata*, Ik: *Indigofera kirilowii*, Jr: *Juniperus rigida*, Lb: *Lespedeza bicolor*, Le: *Lindera erythrocarpa*, Mc: *Milium effusum*, Mm: *Meliosma myriantha*, Mr: *Melampyrum roseum*, Pd: *Pinus densiflora*, Pt: *Polystichum tripteron*, Qm: *Quercus mongolica*, Qs: *Quercus serrata*, Qv: *Quercus variabilis*, Rm: *Rhododendron mucronulatum*, Rs: *Rhododendron schlippenbachii*, Rt: *Rhus tricocarpa*, Ry: *Rhododendron yedoense* var. *poukhanense*, Sc: *Smilax china*, Si: *Stephanandra incisa*, Sj: *Sapium japonicum*, Tn: *Torreya nucifera*, Vd: *Viburnum dilatatum*, Zp: *Zanthoxylum piperitum*, Zs: *Zelkova serrata*.

Group 2. (lower left-hand side of the Figure 3)

Subgroup 1): *Meliosma myriantha*, *Stephanandra incisa* and *Carpinus tschonoskii*.

Subgroup 2): *Sapium japonicum*, *Rhus tricarpa*, *Viburnum dilatatum* and *Carpinus laxiflora*.

Subgroup 3): *Lespedeza bicolor*, *Indigofera kirilowii* and *Quercus variabilis*.

Group 3. (upper right-hand side of the Figure 3): *Zelkova serrata*, *Acer pseudo-sieboldianum* var. *koreanum* and *Zanthoxylum piperitum*.

Subgroup 1): *Acer mono*, *Celtis sinensis*, *Polysticum tripterion* and *Hydrangea serrata* for. *acuminata*.

Subgroup 2): *Torreya nucifera*, *Adenocaulon himalaicum* and *Disporum sessile*.

subgroup 3): *Lindera erythrocarpa*, *Cornus controversa*, *Arisaema amurense* and *Alangium platanifolium* var. *macrophyllum*.

Group 4. (lower right-hand side of the Figure 3): *Quercus mongolica*, *Acer pseudo-sieboldianum*, *Fraxinus sieboldiana*, *Rhododendron schlippenbachii*, *Melampyrum roseum* and *Ainsliaea acerifolia*.

Group 1 was found on areas destroyed by human activity and the hillock and exposed ridge line, dry and poor habitat of the mountain. The distributional range of this group was coincided with that of Rhododendro-Pinion densiflorae in classification by Z-M method.

Group 2 was found at mesic-fertile sites in elevations below 600 m and coincided with Carpinion laxiflorae. Subgroup 1 of the group occurred on lower parts of the slope and mesic sites, subgroup 2 on middle parts of the slope and subgroup 3 on sunny and xeric hillsides, and they were coincided with Carpinetum tschonoskii, Carpinetum laxiflorae and Quercetum variabilis, respectively.

Group 3 was found at the well drained stony slopes near stream and coincided with Corno-Zelkovion serratae. Subgroup 1 of the group occurred on the lower parts of the slope and mesic stony sites, subgroup 2 on lower parts of the slope and subgroup 3 on lower parts of the slope, ravines, shade and humid sites, and they were coincided with Acero-Zelkovetum serratae, Torreyo-Zelkovetum serratae and Corno-Linderetum erythrocarpae, respectively.

Group 4 developed at xeric-sterile sites of elevation above 600 m and this was coincided with Acero-Quercion mongolicae.

As mentioned above, the results of correlation analysis between species were reflected to the phytosociological classification units by floristic composition.

摘要

1985年부터 1987년까지 內藏山 國立公園의 森林植物을 Z-M法으로 調査하여 1개의 群目, 4개의 群團과 10개의 群集 單位를 識別하였다. 이들을 다른 地域의 植生資料들과 比較 檢討한 結果 內藏山 森林植物의 分類體系는 다음과 같다.

줄참나무-신갈나무群目(Quercetalia serrato-mongolicae ord. nov.)

진달래-소나무群團(Rhododendro-Pinion densiflorae all. nov.)

진달래-소나무群集(Rhododendro mucronulati-Pinetum densiflorae Kim et Yim 1986)

당단풍-신갈나무群團(Accro-Quercion mongolicae all. nov.)
 철쭉꽃-신갈나무群集(Rhododendro-Quercetum mongolicae assoc. nov.)
 서어나무群團(Carpinion laxiflorae Kim et Yim 1986)
 굴참나무群集(Quercetum variabilis Kim et Yim 1986)
 서어나무群集(Carpinetum laxiflorae Kim et Yim 1986)
 개서어나무群集(Carpinetum tschonoskii Kim et Yim 1986)
 굴거리나무群落(Daphniphyllum mecopodium community)
 칠참나무-개서어나무群落(Quercus aliena-Carpinus tschonoskii community)
 층층나무-느티나무群團(Corno-Zelkovion serratae all. nov.)
 층층나무-비목나무群集(Corno-Linderetum erythrocarpae assoc. nov.)
 비자나무-느티나무群集(Torreyo-Zelkoventum serratae assoc. nov.)
 고로쇠나무-느티나무群集(Acero-Zelkovetum serratae assoc. nov.)
 이들 중 층참나무-신갈나무群目, 진달래-소나무群團, 당단풍-신갈나무群團, 층층나무-느티나무群團, 철쭉꽃-신갈나무群集, 층층나무-비목나무群集, 비자나무-느티나무群集과 고로쇠나무-느티나무群集은 著者들에 의해서 새로 命名되었다. 한편 重要種들의 相關分析에 의한 種結合으로 群(group)과 亞群(subgroup)은 各各 分類法에 의한 群團(alliance) 그리고 群集(association)과 一致하였다.
