# Deoxygenation of $\beta$-Aryl $\alpha, \beta$-Epoxy Silanes to Vinylsilanes by Magnesium-Magnesium Halide 

Kyung-Tae Kang*, Chun Yi Park, and Joung Sook Kim<br>Departinent of Chemical Education, Pusan National University, Pusan 609-735<br>Received September 17, 1991

#### Abstract

The reactions of $\beta$-aryl- $\alpha, \beta$-epoxy silanes with magnesium bromide or magnesium iodide in the presence of excess magnesium in ether at room temperature afforded vinylsilanes in $18-100 \%$ yields. E-Vinylsilanes were predominant over Z-isomers ( $>80 \%$ ) regardless of the stereochemistry of $\alpha, \beta$-epoxy silanes.

## Introduction

The deoxygenation of epoxides to olefins has been studied and numerous reagents have been developed. ${ }^{1}$ The deoxygenation of a, $\beta$-epoxy silanes was largely ignored in spite of its synthetic interest. ${ }^{2}$ This reaction could provide a good route to vinylsilanes which have received increasing attention as a highly versatile synthon in organic synthesis. ${ }^{3} \mathrm{Y}$.

Ito and coworkers have reported that copprer-catalyzed Grignard reagent caused deoxygenation of $\alpha, \beta$-epoxy silanes having one or two alkoxy groups on silicon. ${ }^{4}$ However, the reaction with $\alpha, \beta$-epoxy trimethylsilanes gave a normal ringopening product. No deoxygenation was observed. Recently. we found that lithium was more effective than copper-catalyzed Grignard reagent for the deoxygenation of $\alpha, \beta$-epoxy silanes; $\alpha, \beta$-epoxy trimethylsilanes, which are more readily

${ }^{*}$ Isolated yields. **Determined by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and GC (See Table 2) analysis. ${ }^{* * *}$ See ref. 6 .
available than alkoxysilyl ones underwent the deoxygenation to give vinyisilanes stereoselectively. ${ }^{5}$ The yields of vinylsilanes were good for aliphatic $\alpha, \beta$-epoxy silanes, but, very low for aromatic ones with lithium.

We now report that $\beta$-aryl- $\alpha, \beta$-epoxy silanes can undergo a deoxygenation reaction with magnesium-magnesium halide to afford vinylsilanes in improved yields.

## Results and Discussions

Synthesis of $\alpha, \beta$-Epoxy Silanes. $\alpha, \beta-E p o x y$ trimethylsilanes (3) were prepared by Magnus method. ${ }^{6}$ When a THF solution of chloromethyltrimethylsilane (1) was treated with sec-BuLi ( 1.2 M in cyclohexane) at $-78^{\circ} \mathrm{C}$ in the presence of $\mathrm{N}, \mathrm{N}, \mathrm{N}^{\prime}, \mathrm{N}^{\prime}$-tetramethylethylenediamine (TMEDA) (1.05 eguiv), and then with an aromatic aldehyde 2 between $-78^{\circ} \mathrm{C}$ and $25^{\circ} \mathrm{C}$ a mixture of $Z$ and $E$ isomers of $\alpha, \beta$-epoxy silane 3 was obtained in good yields (Table 1).
The $Z$ and $E$ isomers of 3-(4'-chlorophenyl)-2-trimethylsil-

yloxirane (3b) were isolated by preparative tlc (silica gel, $n$-hexane : ether $=8: 1$ ); the ratio of $Z / E$ isomers was $82: 18$. Both showed $\mathrm{M}+2$ ion at $\mathrm{m} / \mathrm{e} 228$ and molecular ion at $\mathrm{m} / \mathrm{e} 226$ in the mass spectra. Other $\alpha, \beta$-epoxy silanes could only be separated to their Z and E isomers by capillary GC, however, the structures were all assigned by spectroscopic correlation with 2 and E-3b (Table 2).
${ }^{1} \mathrm{H}-\mathrm{NMR}$ data of 3 revealed the following characteristics: (1) the coupling constants between the oxirane ring protons were larger for the $Z$ than for the E isomer (eg., $\mathbf{3 b}$ : 5.4 vs. 3.0 Hz ); (2) The silicon methyls absorbed at slightly higher field for the $Z$ than for the E isomer (eg., 3b: $\delta-0.16$ vs. 0.13 ). Z isomers were prdouced predominantly over E isomers in every case.

Reactions of a, $\beta$-Epoxy Silanes with MagnesiumMagnesium Halide. When the reaction of $\alpha, \beta$-epoxy silane 3b with $\mathrm{Mg}-\mathrm{MgBr}_{2}$ suspension prepared from magnesium ( 3.3 mmol) and dibromoethane ( 2.0 mmol ) in ether ( 3 ml ) was performed at $-10^{\circ} \mathrm{C}$, bromohydrin 5 was produced as a single product in $77 \%$ yleld (Table 3, entry 1). However, when the reaction was carried out at room temperature for 16 h, vinylsilane 4 b ( $25 \%$ ) was obtained along with bromhydrin $5(53 \%)$ (entry 2). Similar results were obtained in homogeoneous $\mathrm{MgBr}_{2}$ etherate prepared by using a large amount of ether (entry 3).

*Reaction was carried out at room temperature except entry 1 (at $-10^{\circ}$ ). ${ }^{* *}$ Isolated yield.

When the reaction was carried out with more than three equivalents of $\mathrm{MgBr}_{2}$ in the presence of more than two equivalents of excess magnesium, only vinylsilane 4 b was obtained in $74 \%$ yield (entry 4). Large excess of Mg and $\mathrm{MgBr}_{2}$ improved the yield of $\mathbf{4 b}$ (entry 5). However, when less than three equivalents of $\mathbf{M g B r}_{2}$ was used the yield became lower (entry 6). Vinylsilane $\mathbf{4 b}$ was not formed in the absence of excess magnesium (entry 7).

Since we found that $\mathrm{Mg}-\mathrm{MgBr}_{2}$ etherate was effertive for the deoxygenation of $\mathbf{a}, \boldsymbol{\beta}$-epoxy silane $\mathbf{3 b}$ to vinylsilane $\mathbf{4 b}$, we examined this for other a,f-epoxy silanes to confirm its generality. The reactions of $\mathbf{3 a}, \mathbf{3 b}$ and $\mathbf{3 d}$ with $\mathbf{~} \mathbf{M g}-\mathrm{MgBr}_{2}$
etherate at room temperature afforded vinylsilanes $\mathbf{4 a}$, $\mathbf{4 b}$ and $\mathbf{4 d}$ as single products in good yields, respectively (Table 4 , entries 2, 3 and 6). From the reactions of 3 e and 3 f with $\mathrm{Mg}-\mathrm{MgBr}_{2}$ the vinylsilanes 4 e and 4 f were also obtained respectively, however, the yields were very low (Table 4, entries 7 and 9).

Magnesium-magnesium iodide etherate was also effective for the deoxygenation of $\alpha, \beta$-epoxy silanes. The yields of the vinylsilanes $\mathbf{4 h}$, $\mathbf{4 f}$ and $\mathbf{4 h}$ were greatly improved than those in the reactions with $\mathrm{Mg}-\mathrm{MgBr}_{2}$ (Table 4, entries 3, 10 and 13). However, there was no considerable improvement in the cases of 3 e and $\mathbf{3 g}$ (Table 4, entries 8 and 12).
The reactions of 3 with $\mathrm{Mg}-\mathrm{MgX}_{2}$ afforded a mixture of $E$ and $Z$ isomers of vinylsilanes $4 . Z$ and $E$ isomers of 4 could only be separated by capillary GC with the retention time of E isomer being longer than that of 2 isomer in each case. In the ${ }^{1} \mathrm{H}$-NMR spectra, the silicon methyls appeared at slightly lower field for the $\mathbf{E}$ than for the Z isomer (eg., 4b: $\delta 0.10 \mathrm{vs} .0 .00$ ), and the coupling constants between the vinylic protons were larger for the E than for the Z isomer (eg., 4b: 19.4 vs. 15.1 Hz ). The vinylic protons appeared as a pair of doublets (eg., $\mathbf{4 b}$ : $\delta 6.39$ and 6.75 ) in E isomers, while one of them ( ArCH ) overlapped with the aromatic proton signals in Z isomer. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectral data and ratio of $Z$ and $E$ isomers of 4 were summarized in Table 5 . It is interesting to note that the deoxygenation of $\alpha, \beta$-epoxy silanes 3 with $\mathrm{Mg}-\mathrm{MgX}_{2}$ afforded E isomer of vinylsilanes 4 in greater than $80 \%$. The stereoselectivity observed in this reaction is very similar to the results by It $0^{4}$, Barluenger ${ }^{7}$ and $u s^{5}$.

In every case, the halohydrins were the $\alpha$-halo- $\beta$-hydroxysilanes. The structure bromohydrin 5 5a was readily confirmed by the downfield shift of the $\beta$-protons ( CH HOH ) in the ${ }^{\text {' }} \mathrm{H}-\mathrm{NMR}$ spectrum of its acetate derivtive 7. The methine protons of 5a appeared as a pair of doublet $(J=6.0 \mathrm{~Hz})$ at $\delta 3.65(\mathrm{HCBr})$ and $4.84(\mathrm{CHOH})$, while the latter one was shifted to downfield ( $\delta 5.95$ ) in 7 . The halohydrins $\mathbf{5 b}, \mathbf{5 c}, 5 f$ and $\mathbf{6 g}$ were identified by comparision of the chemical shifts of the methine protons in ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectum with those of 5 a .

The exclusive $\alpha$-regioselective ring-opening of aliphatic $\alpha$, $\beta$-epoxy silanes in reactions with magnesium halide ${ }^{8}$ and various nucleophiles ${ }^{9}$ is well estabilished. Such an exclusive $a$-opening was also observed even in the aromatic $\alpha, \beta$-epoxy silanes 3 where $\beta$-cleavage would result in a developing benzyl cation $\beta$ to silicon.

The bromohydrin 5b was treated with ethylmagnesium bromide in ether in order to prepare magnesium bromide salt of $\mathbf{5 b}$, and then this solution was added to the etheral solution of Mg ( 2.7 equiv) and $\mathrm{MgBr}_{2}$ ( 4.0 equiv). The resulting mixture was stirred at room temperature for 21 h , vinylsilane 4b was also formed in $51 \%$ yield. As shown in
entry 7 of Table 3 , vinylsilane 4 b was not produced at all when the reaction was performed in the absence of excess magnesium. Based on these observations, we propose a reaction mechanism for the deoxygenation. The magnesium halide induced $a$ ring-opening of $\alpha, \beta$-epoxy silane affords the magnesium salft of halohydrin 8 , which react with excess magnesium to produce Grignard reagent 9. The spontaneous $\beta$-elimination of this unstable Grignard reagent leads to the expected vinylsilanes $4 .{ }^{10}$

It is interesing to note that further rearrangement of the magnesium salt of halohydrin to a-trimethylsilyl aldehyde $(8 \rightarrow 10)$ was not observed in this reaction when the excess magnesium was present. ${ }^{11}$ This indicates that the Grig. nard reagent ( $8 \rightarrow 9$ ) forms faster than the rearrangement product. However, we found that the rearrangement occurred in the reactions of $\alpha, \beta$-epoxy silanes with Grignard reagents to give $\beta$-hydroxysilane (11) in the absence of excess magnesium. ${ }^{12}$ We will report the results soon.

## Experimental

All reactions were carried out on the argon atomosphere. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were recorded on a Varian EM-360A ( 60 MHz ), a JEOL JSX270 ( 270 MHz ) or a Bruker 300 MHz spectrometer using tetramethylsilane as an internal standard. ${ }^{13} \mathrm{C}$-NMR spectra were obtained on a JEOL JSX 270 ( 58 MHz ) spectrometer with $\mathrm{CDCl}_{3}$ as solvent and internal standard. GC-MS analyses were perforrned with a Hewlett-Packard 5971A spectrometer. An HP-1 column ( 0.2 mm ID, 15 m ) was used at $100-280^{\circ} \mathrm{C}$ ( $10^{\circ} \mathrm{C} / \mathrm{min}$ ). Chloromethyltrimethylsilane was purchased from Fluka, distilled before use and stored over molecular sieves 4 A .
Synthesis of a, $\beta$-Epoxy Silanes. sec-BuLi ( 1.2 M in cyclohexane, $12 \mathrm{~m}, 16 \mathrm{mmol}$ ) was added dropwise to a THF $(15 \mathrm{ml})$ solution of chloromethyltrimethylsilane $1(1.84 \mathrm{~g}, 15$ mmol) at $-78^{\circ} \mathrm{C}$ under argon. After 5 min , TMEDA ( 1.86 g, 16 mmol ) was added, and the resulting mixture was stirred for $1 \mathrm{~h} . p$-Chlorobenzaldehyde $\mathbf{2 b}$ ( 1.40 g .10 mmol ) was slowly added to the above solution. The solution was stirred for 40 min at $-50^{\circ} \mathrm{C}$, and then for 2 h at room temperature. The reaction mixture was poured into a saturated aqueous ammonium chloride solution ( 30 ml ) and extracted with di-
chloromethane ( $20 \mathrm{ml} \times 3$ ). The dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ solution was concentrated in vacuo, the residue was distilled with a kugelrohr under reduced pressure ( $70-80^{\circ} \mathrm{C} / 0.1 \mathrm{mmHg}$ ) to give the $Z$ and E mixtures of $\mathbf{3 b}(1.58 \mathrm{~g}, 70 \%)$. The crude product was chromatographed (silica gel $n$-hexane: ether $=8: 1$ ) to give E-3b ( $\mathrm{Rf}=0.70$ ) and $\mathrm{Z}-3 \mathrm{~b}(\mathrm{Rf}=0.65)$. The ratio of Z and E isomers of 3b was determined to be $82: 18$ by preparative tlc and by GC (Z-3b, $R_{t}=6.22 \mathrm{~min}: E-3 \mathrm{~b}, R_{t}=6.68 \mathrm{~min}$ ). 3a and 3 c -j were prepared similarly. The E and Z isomeric ratio of them was determined by 'H-NMR and GC analysis. The yields, the ratio of 2 and $E$ isomers and spectral data of $\alpha, \beta$-epoxy silanes are listed in Table 1 and 2.

General procedure for the reaction of $\alpha, \beta$-epoxy silane with magnesium-magnesium hatide. Deoxygenation reaction of $\mathbf{3 b}$ to $\mathbf{4 b}$ by $\mathrm{Mg}-\mathrm{MgBr}_{2}$ is representative. To a suspension of $\mathrm{Mg}-\mathrm{MgBr}_{2}$ prepared from Mg ( 120 mg , 4.9 mmol ) and 1,2 -dibromoethane ( $564 \mathrm{mg}, 3.0 \mathrm{mmol}$ ) in ether ( 3 ml ), 3b ( $200 \mathrm{mg}, 0.89 \mathrm{mmol}$ ) was added at room temperature. After 15 h , the solution was quenched with a saturated aqueous ammonium chloride solution and extracted with dichloromethane ( $20 \mathrm{~m} / \times 2$ ). The combined extracts were concentrated and the residue was chromatographed on silica gel plate ( $n$-pentane) to afford a mixture of E and Z isomers of vinylsilane 4 b ( $139 \mathrm{mg}, 74 \%$ ). The ratio of $E$ and Z isomers was determined by GC analysis. E-4b: GC 5.84 $\min (89 \%)$; MS $212(\mathrm{M}+2,10), 210\left(\mathrm{M}^{+}, 25\right), 197$ (34), 195 $\left(\mathrm{M}^{+}-\mathrm{CH}_{3}, 100\right), 181$ (21), 179 (55), 169 (22), 159 (15), 115 (15), 73 (Me ${ }_{3} \mathrm{Si}_{7} 7 \%$ ). Z-4b: GC $4.80 \mathrm{~min}(11 \%)$; MS 212 (M+ $2,8), 210\left(\mathrm{M}^{+}, 19\right), 197(37), 195$ (100), 181 (21), 179 (56), 169 (23), 159 (14), 115 (14) 73 (10\%).

Vinylsilanes $\mathbf{4 a - 4 h}$ were prepared under the reaction conditions described in Table 4. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were summarized in Table 5 and GC-MS and ${ }^{13} \mathrm{C}$-NMR data were as follows.

Bromohydrin 5. To a suspension of magnesium ( 49 mg , 2.0 mmol ) in ether ( 3 ml ) was added 1,2 -dibromoethane ( 376 $\mathrm{mg}, 2.0 \mathrm{mmol}$ ) at room temperature. The resulting mixture was cooled to $-10^{\circ} \mathrm{C}$ before the addition of 3 a ( $170 \mathrm{mg}, 0.89$ mmol) solution in ether ( 1 ml ). After 40 min , the solution was quenched with aq $\mathrm{NH}_{4} \mathrm{Cl}$, and extracted with dichloromethane ( $20 \mathrm{~m} / \times 2$ ). Purification by silica gel column chromatography, ( $n$-hexane : ether $=8: 1$ ) gave 235 mg (97\%) of 5a. 'H-NMR $\delta 0.17$ (s, 9H, SiMe ${ }^{\text {3 }}$ ), 2.56 (brs, $1 \mathrm{H}, \mathrm{OH}$ ) 3.65 $(\mathrm{d}, 1 \mathrm{H}, J=6.0 \mathrm{~Hz}, \mathrm{HCBr}), 4.84(\mathrm{~d}, 1 \mathrm{H}, J=6.0 \mathrm{~Hz}, \mathrm{HCOH})$ 7.2-7.4 ( $\mathrm{m}, 5 \mathrm{H}$ ).

The acetate 7 was prepared from the bromohydrin $5 a$ and acetic anhydride in pyridine $\left(100^{\circ} \mathrm{C}, 3 \mathrm{~h}\right)$. ${ }^{1} \mathrm{H}-\mathrm{NMR}(60 \mathrm{MHz})$ $\delta 0.10(\mathrm{~s}, 9 \mathrm{H}), 2.13(\mathrm{~s}, 3 \mathrm{H}), 3.60(\mathrm{~d}, 1 \mathrm{H}, J=6.0 \mathrm{~Hz}, \mathrm{HCBr})$, $5.95(\mathrm{~d}, 1 \mathrm{H}, J=6.0 \mathrm{~Hz}, \underline{\mathrm{HCOAc}}), 7.4(\mathrm{~s}, 5 \mathrm{H})$.
$\alpha, \beta$-Epoxy silane 3b ( $226 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) was treated with a suspension of $\mathrm{Mg}-\mathrm{MgBr}_{2}$ prepared from magnesium ( 80 $\mathrm{mg}, 3.3 \mathrm{mmol}$ ) and 1,2 -dibromoethane ( $376 \mathrm{mg}, 2.0 \mathrm{mmol}$ ) in ether ( 4 m ) at $-10^{\circ} \mathrm{C}$ for 5 h . Work-up as for 5 a gave 237 mg ( $77 \%$ ) of 5 b. ${ }^{1} \mathrm{H}-\mathrm{NMR} \delta 0.05$ ( $\mathrm{s}, 9 \mathrm{H}, \mathrm{SiMe}_{3}$ ), 2.71 (brs, $1 \mathrm{H}, \mathrm{OH}$ ) $3.50(\mathrm{~d}, 1 \mathrm{H}, J=4.9 \mathrm{~Hz}, \mathrm{HCBr}), 4.85(\mathrm{~d}, 1 \mathrm{H}$, $J=4.9 \mathrm{~Hz}, \mathrm{HCOH}), 7.2-7.4(\mathrm{~m}, 4 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR} \delta-2.09,52.73$, 74.10, 127.78, 128.63, 133.95, 140.11; MS m/e 220 (25), 218 (100), $216\left(\mathrm{M}^{+}-\mathrm{Me}_{3} \mathrm{SiOH}, 80\right), 141\left(\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{CHOH}, 93\right), 137$ $\left(\mathrm{M}^{+}-\mathrm{Me}_{3} \mathrm{SiOH} \cdot \mathrm{Br}, 60\right), 73$ ( $\mathrm{Me}_{3} \mathrm{Si}, 44 \%$ ).

To a suspension of $\mathrm{Mg}-\mathrm{MgBr}_{2}$ prepared from magnesium ( $120 \mathrm{mg}, 4.9 \mathrm{mmol}$ ) and 1,2-bromoethane ( $564 \mathrm{mg}, 3.0 \mathrm{mmol}$ ) in ether ( 5 ml ), 3d ( $200 \mathrm{mg}, 0.89 \mathrm{mmol}$ ) was added at room temperature. After 18 h , work up described above and chromatography on silica gel plate ( $n$-hexane : ether $=8 ; 1$ ) gave vinylsilane 4 d ( $\mathbf{4 0} \mathrm{mg}, 22 \%$ ) and bromohydrin 5 d ( 160 mg , $59 \%$ ). ${ }^{\text {th }} \mathrm{H}-\mathrm{NMR}$ ( 60 MHz ) $\delta 0.33$ (s, $9 \mathrm{H}, \mathrm{SiMe}_{3}$ ), 2.7 (br, 1 H , OH ), 3.85 (d, $1 \mathrm{H}, J=4.0 \mathrm{~Hz}, \mathrm{HCBr}), 5.3$ (brs, $1 \mathrm{H}, \underline{\mathrm{HCOH}}$ ), 7.1-7.6 (m, 4H).

To a suspension of $\mathrm{Mg}-\mathrm{MgBr}_{2}$ prepared from Mg ( 120 mg , 4.9 mmol ) and 1,2 -bromoethane ( $564 \mathrm{mg}, 3.0 \mathrm{mmol}$ ) in ether ( 5 ml ), 3f ( $240 \mathrm{mg}, 0.89 \mathrm{mmol}$ ) was added at room temperature. After 22 h , work up and purification by PLC (silica gel, $n$-hexane ; ether $=8: 1$ ) afforded vinylsilane $4 f(49 \mathrm{mg}$, $22 \%$ ) and bromohydrin 55 ( $201 \mathrm{mg}, 64 \%$ ). ${ }^{\text {² }} \mathrm{H}-\mathrm{NMR}$ ( 60 MHz , $\left.\mathrm{CCl}_{4}\right) \delta 0.04\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiMe}_{3}\right), 2.20(\mathrm{brs}, 1 \mathrm{H}, \mathrm{OH}), 3.55(\mathrm{~d}, 1 \mathrm{H}$, $J=3.9 \mathrm{~Hz}, \underline{\mathrm{HCBr}}$ ), 4.93 (brs, $1 \mathrm{H}, \underline{\mathrm{HCOH}), ~ 6.7-7.3(\mathrm{~m}, 4 \mathrm{H}) \text {. }}$
lodohydrin 6g. To a suspension of $\mathrm{Mg}_{\mathrm{Mg}}^{2}$ prepared from Mg ( $240 \mathrm{mg}, 9.9 \mathrm{mmol}$ ) and iodine ( $1.12 \mathrm{~g}, 4.0 \mathrm{mmol}$ ) in ehter ( 10 m ), $\mathbf{3 g}$ ( $190 \mathrm{mg}, 0.92 \mathrm{mmol}$ ) was added and stirred at room temperature for 14 h . After treatment described above 4 g ( $26.3 \mathrm{mg}, 15 \%$ ) and $\mathbf{6 g}$ ( $133 \mathrm{mg}, 43 \%$ ) were
obtained. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(60 \mathrm{MHz}, \mathrm{CCl}_{4}\right) \delta 0.30\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiMe}_{3}\right), 2.25$ (brs, $1 \mathrm{H}, \mathrm{OH}$ ), $2.47(\mathrm{~s}, 3 \mathrm{H}), 3.60(\mathrm{~d}, 1 \mathrm{H}, J=5.0 \mathrm{~Hz}, \mathrm{HCBr}$ ), $4.43(\mathrm{~d}, 1 \mathrm{H}, J=5.0 \mathrm{~Hz}, \underline{\mathrm{H} C O H}), 7.1(\mathrm{~s}, 4 \mathrm{H})$.
