### ON FUZZY S-CONTINUOUS FUNCTIONS

#### WON KEUN MIN

ABSTRACT. We introduce the concepts of fuzzy s-continuous functions. And we investigate several properties of the fuzzy s-continuous function. In particular, we study the relation between fuzzy continuous functions and fuzzy s-continuous functions.

#### 1. INTRODUCTION

Fuzzy topological spaces were first introduced in the literature by Chang [1] who studied a number of the basic concepts including fuzzy continuous maps and compactness. And fuzzy topological spaces are a very natural generalization of topological spaces. In 1983, A.S. Mashhour et al.[3] introduced supra topological spaces and studied scontinuous functions and  $s^*$ -continuous functions. In 1987, M.E. Abd El-Monsef et al.[2] introduced the fuzzy supra topological spaces and studied fuzzy supra-continuous functions and characterized a number of basic concepts. Also fuzzy supra topological spaces are generalizations of supra topological spaces. In this paper, we introduce fuzzy s-continuous function and establish a number of characterizations. Let X be a set and let I = [0,1]. Let  $I^X$  denote the set of all mapping  $a: X \to I$ .

A member of  $I^X$  is called a fuzzy subset of X. And unions and intersections of fuzzy sets are denoted by  $\vee$  and  $\wedge$  respectively and defined by

$$\forall a_i = \sup\{a_i(x) \mid i \in J \text{ and } x \in X\},\$$
  
 $\land a_i = \inf\{a_i(x) \mid i \in J \text{ and } x \in X\}.$

Key words and phrases. fuzzy s-continuous, fuzzy continuous, fuzzy supra topological space, fuzzy supracontinuous.

DEFINITION 1.1[1]. A fuzzy topology T on X is a collection of subsets of  $I^X$  such that

- $(1) 0, 1 \in T$ ,
- (2) if  $a, b \in T$ , then  $a \wedge b \in T$ ,
- (3) if  $a_i \in T$  for all  $i \in J$ , then  $\forall a_i \in T$ .
- (X,T) is called a fuzzy topological space. Members of T are called fuzzy open sets in (X,T) and complement of a fuzzy open set is called a fuzzy closed set.

DEFINITION 1.2. Let f be a mapping from a set X into a set Y. Let a and b be the fuzzy sets of X and Y, respectively. Then f(a) is a fuzzy set in Y, defined by

$$f(a)(y) = \begin{cases} \sup_{z \in f^{-1}(y)} a(z), & \text{if } f^{-1}(y) \neq \emptyset, \ y \in Y \\ 0, & \text{otherwise,} \end{cases}$$

and  $f^{-1}(b)$  is a fuzzy set in X, defined by  $f^{-1}(b)(x) = b(f(x)), x \in X$ .

DEFINITION 1.3[3]. A subfamily  $T^*$  of  $I^X$  is said to be a fuzzy supra-topology on X if

- $(1) 1 \in T^*,$ 
  - (2) if  $a_i \in T^*$  for all  $i \in J$ , then  $\forall a_i \in T^*$ .
- $(X, T^*)$  is called a fuzzy supra topological space. The elements of  $T^*$  are called fuzzy supra open sets in  $(X, T^*)$ . And a fuzzy set a is supra closed iff co(a) = 1 a is a fuzzy supra open set. And the fuzzy supra topological spaces  $T^*$  is denoted by fsts.

DEFINITION 1.4[3]. The supra closure of a fuzzy set a is denoted by scl(a), and given by

$$scl(a) = \wedge \{s \mid s \text{ is a fuzzy supra closed set and } a \leq s\}.$$

The supra interior of a fuzzy set a is denoted by si(a) and given by

$$si(a) = \bigvee \{t \mid t \text{ is a fuzzy supra open set and } t \leq a\}.$$

# 2. Fuzzy s-continuous function

DEFINITION 2.1[2]. Let (X,T) be a fuzzy topological space and  $T^*$  be a fuzzy supra-topology on X. We call  $T^*$  a fuzzy supra-topology associated with T if  $T \subset T^*$ .

DEFINITION 2.2[2]. Let  $f:(X,T^*)\to (Y,S^*)$  be a mapping between two fuzzy supratopological spaces. f is a fuzzy supracontinuous function if  $f^{-1}(S^*)\subseteq T^*$ .

DEFINITION 2.3. Let (X,T) and (Y,S) be fuzzy topological spaces and  $T^*$  be an associated fuzzy supra-topology with T. A function  $f: X \to Y$  is a fuzzy s-continuous function if the inverse image of each fuzzy open set in Y is  $T^*$ -fuzzy supra open in X.

THEOREM 2.4. Let (X,T) and (Y,S) be fts. Let f be a function from X into Y. Let  $T^*$  be an associated fuzzy supra-topology with T. Then the followings are equivalent:

- (1) f is fuzzy s-continuous.
- (2) The inverse image of each fuzzy closed set in Y is  $T^*$ -fuzzy supra closed.
- (3)  $scl(f^{-1}(a)) \leq f^{-1}(cl(a))$  for every fuzzy set a in Y.
- (4)  $f(scl(a)) \le cl(f(a))$  for every fuzzy set a in X.
- (5)  $f^{-1}(int(b)) \leq si(f^{-1}(b))$  for every fuzzy set b in Y.
- (6) For each fuzzy set a in X and each fuzzy neighborhood b of f(a), there is a fuzzy supra neighborhood c of a such that  $f(c) \leq b$ .

PROOF. (1)  $\Rightarrow$  (2). Let a be fuzzy closed set in Y. Since f is a fuzzy s-continuous,  $f^{-1}(1-a) = 1 - f^{-1}(a)$  is fuzzy supra open in X. Therefore  $f^{-1}(a)$  is a fuzzy supra closed set in X.

 $(2) \Rightarrow (3)$ . Since cl(a) is fuzzy closed for every fuzzy set a in Y,  $f^{-1}(cl(a))$  is  $T^*$ -fuzzy supra closed. Therefore,

$$f^{-1}(cl(a)) = scl(f^{-1}(cl(a))) \ge scl(f^{-1}(a)).$$

- $(3) \Rightarrow (4)$ . Let a be fuzzy subset in X and let f(a) = b. Then  $f^{-1}(scl(b)) \geq scl(f^{-1}(b))$ . So  $f^{-1}(cl(f(a))) \geq scl(f^{-1}f(a)) \geq scl(a)$ , and hence  $cl(f(a)) \geq f(scl(a))$ .
- $(4) \Rightarrow (2)$ . Let b be a fuzzy closed set in Y and be  $a = f^{-1}(b)$ . Then  $f(scl(a)) \leq cl(f(a)) = cl(f(f^{-1}(b))) \leq cl(b) = b$ . Since  $scl(a) \leq f^{-1}(f(scl(a)) \leq f^{-1}(b) = a$ , then a is  $T^*$ -fuzzy supra closed.

- $(2) \Rightarrow (1)$ . Obvious.
- $(1) \Rightarrow (5)$ . Let b be a fuzzy subset in Y. Since  $f^{-1}(int(b))$  is  $T^*$ -fuzzy supra open set in X,  $f^{-1}(int(b)) \leq si(f^{-1}(int(b))) \leq si(f^{-1}(b))$ .
- $(5) \Rightarrow (1)$ . Let a be a fuzzy open set in Y. Since  $f^{-1}(a) \leq si(f^{-1}(a)) \leq f^{-1}(a)$ ,  $f^{-1}(a)$  is  $T^*$ -fuzzy supra open.
- $(6) \Rightarrow (1)$ . Let b be any fuzzy open set in Y and let  $f^{-1}(b) = a$ . Then b is a fuzzy neighborhood of  $f(a) = f(f^{-1}(b))$ . There exists a fuzzy supra neighborhood c of  $a = f^{-1}(b)$  such that  $f(c) \leq b$ . Thus  $c \leq f^{-1}f(c) \leq f^{-1}(b)$ . Therefore,  $f^{-1}(b)$  is a fuzzy supra neighborhood of  $f^{-1}(b)$ . And  $f^{-1}(b)$  is a fuzzy supra open set in X, by [6, Theorem 2.2].

$$(1) \Rightarrow (6)$$
. Obvious.  $\square$ 

REMARK. Every fuzzy continuous function is fuzzy s-continuous. But the converse of this implication is not true, as following example shows.

EXAMPLE 2.1. Let  $a_1, a_2,$  and  $a_3$  be fuzzy subsets of X = I, defined as

$$a_1(x) = \begin{cases} 0, & \text{if } 0 \le x \le 1/2, \\ 2x - 1, & \text{if } 1/2 \le x \le 1; \end{cases}$$

$$a_2(x) = \begin{cases} 1, & \text{if } 0 \le x \le 1/4, \\ -4x + 2, & \text{if } 1/4 \le x \le 1/2, \\ 0, & \text{if } 1/2 \le x \le 1; \end{cases}$$

$$a_3(x) = \begin{cases} 1, & \text{if } \le x \le 1/2, \\ -2x + 2, & \text{if } 1/2 \le x \le 1. \end{cases}$$

Consider the fuzzy space  $T_1 = \{0, a_1, a_2, a_1 \lor a_2, 1\}$  and an associated supra fuzzy space  $T_1^* = \{0, a_1, a_2, a_3, a_1 \lor a_2, a_1 \lor a_3, 1\}$ . Let  $g: X \to X$  be defined by g(x) = (1/2)x. Clearly, we have  $g^{-1}(0) = 0$ ,  $g^{-1}(1) = 1$ ,  $g^{-1}(a_1 \lor a_2) = a_3$ ,  $g^{-1}(a_2) = a_3$ , and  $g^{-1}(a_1) = 0$ .  $co(a_1) = a_3$  is a fuzzy supra open in  $(X, T_1^*)$  but it is not fuzzy open in  $(X, T_1)$ . Hence the fuzzy mapping g is fuzzy g-continuous but not fuzzy continuous.

REMARK. In general, the composition of two fuzzy s-continuous functions need not be fuzzy s-continuous.

EXAMPLE 2.2. Let X = I. Consider the fuzzy sets

$$a(x) = \begin{cases} 1, & \text{if } 0 \le x < 1/3\\ 1/2, & \text{if } 1/3 \le x \le 2/3\\ 0, & \text{if } 2/3 < x \le 1, \end{cases}$$

$$b(x) = 1/2, \text{if } 0 \le x \le 1,$$

$$c(x) = 1/3, \text{if } 0 \le x \le 1.$$

Let  $T_1 = \{0, a, 1\}$  and  $T_1^* = \{0, a, b, a \lor b, 1\}$ . Let  $T_2 = \{0, c, 1\}$  and  $T_2^* = \{0, a, c, a \lor c, 1\}$ . Let  $f: (X, T_1) \to (X, T_1)$  be a fuzzy mapping defined by f(x) = (x + 1)/3. Let  $g: (X, T_2) \to (X, T_1)$  be a fuzzy mapping defined by g(x) = (1/3)x. Clearly, f and g are fuzzy scontinuous. But  $(f \circ g)$  is not fuzzy s-continuous, since a is a fuzzy open set in  $(X, T_1)$  but  $(f \circ g)^{-1}(a) = b$  is not fuzzy supra open in  $T_2^*$ .

THEOREM 2.5. If a fuzzy mapping  $f:(X,T_1) \to (Y,T_2)$  is fuzzy s-continuous and  $g:(Y,T_2) \to (Z,T_3)$  is fuzzy continuous, then  $(g \circ f)$  is fuzzy s-continuous.

PROOF. The proof is clear by the definitions of fuzzy s-continuous functions and fuzzy continuous functions.  $\Box$ 

THEOREM 2.6. Let (X,T) and (Y,S) be fts,  $T^*$  and  $S^*$  be two associated fuzzy supra-topologies with T and S, respectively. If  $f: X \to Y$  is a fuzzy mapping, and one of the followings;

- (1)  $f^{-1}(si(a)) \leq int(f^{-1}(a))$  for each fuzzy set a in (Y, S),
- (2)  $cl(f^{-1}(a)) \leq f^{-1}(scl(a))$  for each fuzzy set a in (Y, S),
- (3)  $f(cl(b)) \leq scl(f(b))$  for each fuzzy set b in (X,T), holds, then f is fuzzy continuous.

PROOF. If the condition (2) is satisfied, let b be a fuzzy closed set in Y, then  $cl(f^{-1}(b)) \leq f^{-1}(scl(b)) = f^{-1}(b)$ . Therefore  $f^{-1}(b)$  is a fuzzy closed set in X.

If the condition (3) is satisfied, let b be a fuzzy subset in Y, then  $f^{-1}(b)$  is a fuzzy subset in X and  $f(cl(f^{-1}(b))) \leq scl(f(f^{-1}(b)))$ . Thus  $cl(f^{-1}(b)) \leq f^{-1}(scl(b))$ . Therefore, since the condition (2) is satisfied, f is a fuzzy continuous function.

Similarly, we can prove in the case (1).  $\square$ 

LEMMA [4]. Let  $g: X \to X \times Y$  be the graph of a fuzzy mapping  $f: X \to Y$ . Then, if a is a fuzzy set in X and b is a fuzzy set in Y,  $g^{-1}(a \times b) = a \wedge f^{-1}(b)$ .

THEOREM 2.7. Let  $f:(X,T) \to (Y,S)$  be a fuzzy mapping and  $T^*$  be an associated supra-topology with T. Let  $g:X \to X \times Y$ , given by g(x) = (x, f(x)) be its graph mapping. If g is fuzzy s-continuous, then f is fuzzy s-continuous.

PROOF. Suppose that g is a fuzzy s-continuous and a is a fuzzy open set in (Y, S). Then  $f^{-1}(a) = 1 \wedge f^{-1}(a) = g^{-1}(1 \times a)$ . Therefore,  $f^{-1}(a)$  is a fuzzy supra open set in  $(X, T^*)$ .  $\square$
