# A Synthesis of Optically Active cis and trans 2-(5-Hydroxypiperidin-2-yl)acetates 

P. N. Reddy, Sang-soo Han, and Kyoo-hyun Chung*<br>Department of Chemistry, Inha University, Inchon 402-751, Korea Received March 21, 1998

In dealing with stereochemical issues in the synthesis of antitumor agent DKP 593A, isolated from the soil microorganism Steptomyces griseoluteus, ${ }^{1}$ the stereochemistry of 2,5 -disubstituted piperidines should be controlled. Many of them are found as biologically active compounds in nature, such as streptolutin and pseudoconbydrine. ${ }^{2}$

2-(5-Hydroxypiperidin-2-yl)acetate would be a common intermediate in the preparation of hydroxyhomopipecollic acid and pseudoconhydrine. ${ }^{3}$ In this paper, we would like to report a synthesis of cis and trans 2-[5-(t-butyldimethyl-silyloxy)piperidin-2-yl]acetates from ( $S$ )-5-hydroxy-2-oxopiperidine (1) which was readily available from L -glutamic acid. ${ }^{4}$

Hydroxy group of 1 was protected by $t$-butyldimethylsilyl group to give silyloxy lactam 2. The lactam 2 was treated with trimethyloxonium tetrafluoroborate and the resulting imino methyl ether was condensed with Meldrum's acid to afford adduct 3. The resulting adduct was reacted with NaOMe in MeOH at refluxing temperature to give conjugated ester $4 .{ }^{5}$ Herdeis and coworkers also prepared the corresponding ethyl ester of compound 4 from an intermediate in the preparation of ( $S$ )-5-bydroxy-2-oxopiperidine (1), while we are preparing this manuscript. ${ }^{3 c}$ In the preparation of 4 , yield and the number of steps are almost same in both methods.

Reduction of 4 gave a mixture of cis and trans ester 5 which was separated by columm chromatography (Scheme 1). The ratio of the cis to trans isomer was about $20: 1$ by hydrogenation on $10 \% \mathrm{Pd} / \mathrm{C}$, ${ }^{3 c}$ and $4: 6$ by $\mathrm{NaBH}_{3} \mathrm{CN}$. Herdeis also prepared a derivative of $\mathbf{5}$ using different method from 1, which gave the mixture of trans and cis isomers in a ratio of $3: 1 .^{3 a}$

On the other hand, the adduct 3 was reacted with $\mathrm{NaBH}_{4}$ and then the resulting mixture was treated with 6 N HCl at $110^{\circ} \mathrm{C}$ to give a mixture of cis and trans 5-hydroxyhomo-

Scheme 1. ${ }^{a} t$ - $\mathrm{BuMe}_{2} \mathrm{SiCl}$, imidazole. ${ }^{b}$ i) $\mathrm{Me}_{3} \mathrm{OBF}_{4}$, ii) Meldrum's acid, $\mathrm{Et}_{3} \mathrm{~N}$. ${ }^{\mathrm{c}} \mathrm{NaOMe}, \mathrm{MeOH}, \triangle .{ }^{d} \mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}, 3 \mathrm{~atm}$.

Scheme 2. ${ }^{a} \mathrm{cbz}-\mathrm{Cl}_{1}, \mathrm{Et}_{3} \mathrm{~N} .{ }^{\circ}{ }^{\text {i }}$ ) 6 N HCl , ii) $\mathrm{NaH}, \mathrm{CS}_{2}, \mathrm{MeI}$. ${ }^{c} \mathrm{AlBN},(\mathrm{nBu})_{3} \mathrm{SnH}$, xylene, $\triangle .{ }^{d}(\mathrm{Boc})_{2} \mathrm{O}, \mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}$.
pipecolic acids. ${ }^{36}$ The stereochemistry of the cis and trans isomers could be assingned by ${ }^{1} \mathrm{H}$ NMR, and indirectly confirmed by comparision with the optical rotation of a known compound. ${ }^{8}$

The isomer, which has a lower $\mathrm{R}_{f}$ value on TLC ( $5 \%$ $\mathrm{MeOH} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ), was reacted with benzyl chloroformate ${ }^{36}$ and then treated with 6 N HCl to give desilylated alcohol. Removal of the alcobol moiety was done by a sequence; i.e. conversion of the alcohol to xanthate $7 \mathbf{7 a}$ and cleavage of the xanthate with AIBN and $(n \mathrm{Bu})_{3} \mathrm{SnH}^{6}$. The resulting methyl 2 -( N -benzyloxylcarbonyl)piperidineacetate (8) ${ }^{7}$ was hydrogenated on $10 \% \mathrm{Pd} / \mathrm{C}$ in the presence of di- $t$-butylcarbonate to give methyl 2 -( $N$ - - -butyloxycarbonyl)piperidineacetate $\left[9,[\alpha]^{20}{ }_{p}=-8.1\right.$ (c $\left.\left.0.1, \mathrm{CHCl}_{3}\right)\right]$, which could be assigned $S$ form in comparison with the reported specific rotation $\left[\mathrm{lit} .{ }^{8}[\alpha]_{D}^{20}=-8.3\left(c \quad 0.54, \mathrm{CHCl}_{3}\right)\right]$. In consequence, the stereochemistry of the isomer was cis because both subsituents on the piperidine ring have $S$ configuration (Scheme 2). This result is consistent with X-ray analysis. ${ }^{3 b}$

Using this methodology, 2-alkylpiperidines such as coniine and hygrine could be synthesized as an optically active form. ${ }^{2}$

In conclusion, 2-(5-hydroxy)piperidineacetate can be synthesized via Meldrum's acid adduct. Control of the trans stereochemistry is currently in progress and the diasteroselective reaction on the side chain will be also studied for the synthesis of streptolutin. ${ }^{\circ}$

Acknowledgment. This work was supproted in part by the Organic Chemistry Research Center-the Korean Science and Engineering Foundation. We thank Inha University for providing financial support to Dr. P. N. Reddy as postdoctoral fellowship.
