

The Spider Fauna in Anmyun-do Island from Korea

Joo-Pil Kim

Department of Biology, Dongguk University, Seoul 100-715 Korea
and The Arachnological Institute of Korea

Abstract - The spider fauna in Anmyun-do Island was investigated from 20 th to 24 th Aug. 1999. As a result, 94 species of 66 genera under 18 families were collected. Identified spiders were composed of Palaearctic (6%), Holarctic (7%), Oriental (0.8%), Cosmopolitan (0.8%) species. Araneid, salticid and theridiid spiders were dominant among the spiders. Common species with Japan and China were 93 (72%) and 90 (70%) species, respectively.

Key words : spider fauna, Anmyun-do Island, Korea

Introduction

To clarify the spider fauna of Korean Islands and make sure the distribution of Korean spiders, the faunal researches of Korean Islands, Chin-do (1995), Paiklyeong-do (1996), Gogeum-do (1997), Geoje-do (1998), and Namhae-do (1999) have been carried out annually since 1995. The present research was conducted in Anmyun-do Island, the sixth largest Island in the Korea. The area of this Island is 87.96 km² and the coast line is 120 km. The length of east-west and north-south is each 5.5 km and 24 km as shown in Fig. 1.

Materials and Methods

The spiders were collected by means of visual search

and capture, pitfall-trap, sweeping net method, and beating-sheet method at 16 sites (Fig. 1). Collected spiders were preserved in 80% ethyl alcohol and identified under stereoscopic microscope (Leica MZ Apo) in steeping condition.

Results

As a result, total 2174 individuals of 94 species under 18 families were identified (Table 1). Among the collected families, Araneid, Salticid and Theridiid spiders were dominant families, and Ctenidae, Liocranidae, Uroctidae were rare families in Anmyun-do Island (Table 2). This survey was conducted by various methods to estimate the diverse spider species according to their ecological riches or behaviors. salticid, lycosid and pisaurid spiders were mostly collected by pit-fall traps and araneid, theridiid and linyphid spiders were exclusive caught by visual search and capture, because of their wearing behavior.
