Keywords : Naphthalenes, Baylis-Hillman acetates, Sulfonyl group, Active methylene compounds.

Regioselective synthesis of naphthalene derivatives has been and continues to be of great interest in organic synthesis.^{1,2} New synthetic procedure is still highly desired due to the abundance of the skeleton in many biologically important natural products.^{1,2} Recently we have reported on the synthesis of naphthalenes from the reaction of the Baylis-Hillman acetates derived from *o*-halobenzaldehydes and primary nitro alkanes *via* the successive S_N2' - S_NAr -elimination strategy.²

As an extension of the reaction we examined the reaction with sulfonyl group-containing active methylene compounds **2a-e** as the surrogates of primary nitro alkanes and the Baylis-Hillman acetates **1**. Our rationale was based on the followings: (1) The first S_N2' reaction of **2a-e** in *N,N*-dimethylformamide in the presence of K_2CO_3 would proceed without any problem due to the fact that primary nitro alkanes and active methylene compounds **2** have similar pK_a values.³ (2) By the same reason, the second S_NAr step would give good results. (3) In the final elimination step, elimination of *p*-toluenesulfonic acid or methanesulfonic acid could proceed well as in the case of nitrous acid in our previous paper.²

And finally, (4) many sulfonyl group-containing active methylene compounds are commercially available.

As expected, a variety of 1,3-disubstituted naphthalenes **3a-i** were synthesized in good to moderate yields in a one-pot reaction as shown in Scheme 1. We used three Baylis-Hillman acetates **1a-c** as the representative examples. As the sulfonyl group-containing active methylene compounds we chose (phenylsulfonyl)acetonitrile (**2a**), ethyl methanesulfonylacetate (**2b**), methanesulfonylacetone (**2c**), α -(phenylsulfonyl)acetophenone (**2d**) and bis(phenylsulfonyl)methane (**2e**). The results are summarized in Table 1.

When we used **2a** and **2b**, the corresponding naphthalene derivatives **3a-f** were obtained in good to moderate yields (60-92%, Table 1).⁴ However, in the cases of **2c-e** low yields of products **3g-i** were obtained (23-55%). Low yield of **3g** might be arisen because of the labile acetyl group in the reaction conditions. In the cases of **3h** and **3i**, steric hindrance in the S_NAr step seemed the major reason for low yields.

The reaction mechanism for the formation of **3** was depicted in Scheme 1. The S_N2' type reaction of the *in situ* generated potassium salt of **2** to the Baylis-Hillman acetates **1** gave the *E*-form of cinnamate derivatives **4** as in our previous paper.^{2,5} Under the reaction conditions **4** readily underwent the next S_NAr reaction to give **5**. Trace amounts of the corresponding *Z*-form of **4** cannot undergo the next S_NAr reaction. Finally, a rapid elimination of *p*-toluenesulfonic acid or methanesulfonic acid from **5** gave the naphthalenes **3**.

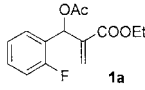

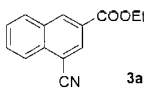

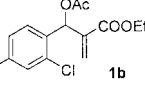

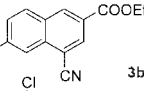

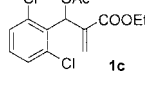

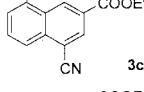

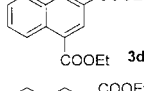

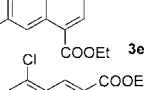

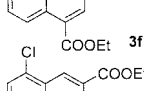

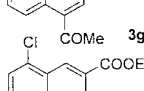

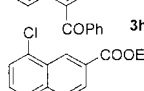

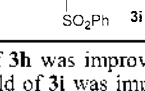

As a conclusion we disclosed a facile methodology for the synthesis of 1,3-disubstituted naphthalenes from the reaction of Baylis-Hillman acetates and sulfonyl group-containing active methylene compounds *via* the successive S_N2' - S_NAr -elimination strategy.

Table 1. Synthesis of 1,3-disubstituted naphthalene derivatives **3a-i**

Entry	B-H acetate 1	Conditions	Product 3	Yield (%) ^a
1		PhSO ₂ CH ₂ CN (2a) K ₂ CO ₃ , DMF rt (10 min) → 60 °C (5 h)		52 (97-98)
2		PhSO ₂ CH ₂ CN K ₂ CO ₃ , DMF rt (10 min) → 60 °C (3 h)		90 (132-133)
3		PhSO ₂ CH ₂ CN K ₂ CO ₃ , DMF rt (10 min) → 60 °C (2 h)		88 (154-155)
4	1a	CH ₃ SO ₂ CH ₂ COOEt (2b) K ₂ CO ₃ , DMF rt (10 min) → 70 °C (36 h)		77 (38-39)
5	1b	CH ₃ SO ₂ CH ₂ COOEt K ₂ CO ₃ , DMF rt (10 min) → 70 °C (36 h)		60 (87-88)
6	1c	CH ₃ SO ₂ CH ₂ COOEt K ₂ CO ₃ , DMF rt (10 min) → 70 °C (18 h)		69 (77-78)
7	1c	CH ₃ SO ₂ CH ₂ COMe (2c) K ₂ CO ₃ , DMF rt (10 min) → 70 °C (12 h)		26 (89-90)
8	1c	PhSO ₂ CH ₂ COPh (2d) K ₂ CO ₃ , DMF rt (10 min) → 90 °C (36 h)		55 ^b (139-140)
9	1c	PhSO ₂ CH ₂ SO ₂ Ph (2e) K ₂ CO ₃ , DMF rt (10 min) → 90 °C (36 h)		23 ^c (170-171)

^aMp was written in parenthesis. ^bThe yield of **3h** was improved up to 70% when we used 2.0 equiv. of **1c**. ^cThe yield of **3i** was improved to 39% when we used 2.0 equiv. of **1c**.
