ABSTRACT

The medicinal plants in 22 uninhabited islands of Jindo-gun, Chonnam provincede were investigated from March 2000 to October 2002. The medicinal plants in 22 uninhabited islands of Jindo-gun were consisted 366 taxa; 95 families, 269 genus, 309 species, 52 varieties, 3 forma, and 2 subspecies. Important medicinal plants on survey area were *Lemmaphyllum microphyllum*, *Dendropanax morbifera*, *Ficus erecta*, *Farfugium japonicum*, *Machilus thunbergii*, *Juniperus chinensis* var. *procumbens*, *Dendrobium moniliforme*, *Pyrrhosia tricuspidata*, *Cinnamomum japonicum*, *Pittosporum tobira*, *Kadsura japonica*, and *Daphniphyllum macropodum*. This result can be used as basic information data for medicinal research and the conservation of uninhabited islands.

Key Words : Uninhabited island, medicinal plants, conservation, flora, taxa

INTRODUCTION

The uninhabited islands of Shinan-gun and Jindo-gun in Southwestern sea are about 67% of it in the Korean peninsula. The uninhabited islands are special environments to plant species because they are far from lands and are exposed to a violent sea winds.

Plants grown on uninhabited islands have the different tolerance against environmental stress of land plants. These areas are suitable environments for growth of subtropical-temperature plants (Yim and Kira, 1975; Yim, 1977). The forests of these areas were widely damaged at the late 20th century because residents near these areas had been used the materials for construction, fishing grounds, room heating and

vessels construction(Chonnam, 1995; Kim, 1987; Kim et al., 1980) Recently, the forests of these areas were restored due to replacement of new heating system of room by electric or oil and movement into inhabited islands. But the forest destruction of uninhabited islands have been accelerating by many anglers and grazing.

Thus, the policy of conservation must be established for special plants and medicinal plants on this area.

The studies of the flora and vegetation of Jindo (Chung, 1957), the plant survey of Jindo(Yang, 1958), the distribution and conservation state for the evergreen broad-leaved trees in islands of South-west seashore (Lee 1979), the plant lists of Jindo-gun (Kim and Park, 1998), phytosociological study on evergreen broad-leaved forest of Korean peninsula (Kim, 1988), the

Corresponding author : Hyo-Sik Yang, (Fax)061-454-0267, (E-mail)hsyang@mokpo.ac.kr

vegetation of Jindo (Kim, 1990), the vegetation of Chodo archipelago (Kim and Oh, 1990), the phytosociological study on the vegetation of Mt. Chomchal (Kim and Woo, 1991), and the phytosociological studies of *Pinus densiflora* forest on islets of Southwestern coast (Yang 2002)

A great parts of those papers were studied for the flora and vegetation of inhabited islands but studies of uninhabited islands were rare. In particular, studies of medicinal plant were lacking. Thus, the study of medicinal plant grown in these areas is very necessary for conservation of island vegetation and common interest of island inhabitants.

This study investigated the flora and ecological characteristics of medicinal plants of 22 uninhabited islands in Jindo-gun from March 2000 to October 2002. The results will provide basic data for the conservation and restoration of vegetation of uninhabited islands.

MATERIALS AND METHODS

1. Study area

The study area chosen is a marine climate, which is warm and humid by means of a warm current of Yellow sea. The average temperature is 13.8°C and the annual precipitation amount to 1,125 mm (KMA 2001). The study islands were as follow:

- A. Kackhuldo (49,893m²) : Jisan-myen Kahackri San-168
- B. Kockdo (38,000m²) : Jisan-myen Kahackri San-69
- C. Chamtudo (9,124m²) : Jisan-myen Kahackri San-170
- D. Kunhamdo (20,900m²) : Jindo-up Suyurl San-53
- E. Sojedo (12,228m²) : Jindo-up Suyurl San-152
- F. Chackdodo (72,500m²) : Jindo-up Sanwulri San-151
- G. Huiodo (41,200m²) : Jindo-up Sanwulri San-150
- H. Songdo (117,800m²) : Jindo-up Sanwulri San-145
- I. Sinuido (198,000m²) : Chodo-myen Chungtungdori

San-57

- J. Changjukdo (290,000m²) : Chodo-myen Changyuri San-2
- K. Haengkumdo (54,000m²) : Chodo-myen Tockgudori San-101
- L. Taesodangdo (8,700m²) : Imhui-myen Kulpori San-68
- M. Sajado (102,600m²) : Imhui-myen Namdongri San-26
- N. Kackgudo (9,000m²) : Imhui-myen Namdongri San-74
- O. Shindo (31,000m²) : Imhui-myen Namdongri San-75
- P. Kambudo (101,719m²) : Kogu-myen Byukcpari San-101
- Q. Wado (4,661m²) : Kogu myen Wunpori San-16
- R. Sosamdo (33,000m²) : Uisin-myen Chosari San-632
- S. Chungsamdo (38,500m²) : Uisin-myen Chosari San-310
- T. Taesamdo (52,800m²) : Uisin-myen Chosari San-312
- U. Mujudo (28,700m²) : Uisin-myen Chosari San-313
- V. Hwangbumdo (21,488m²) : Uisin-myen Mangilri San-173

2. Method

The 22 uninhabited islands in Jindo-gun were surveyed 5 times from March 2000 to October 2002. The medicinal plants were recorded and classified in the field if possible and in laboratory if not possible by means of illustrated book of Korean medicinal herbs(Ahn, 2000). The data were arranged by the method of Fuller and Tippo (Lee, 1993).

RESULTS AND DISCUSSION

The flora of medicinal plants in 22 uninhabited

islands were total 366 species, 95 families, 309 genus, 52 variants, 3 form, and 2 subspecies (Table 1, 2). This result was 23% of about 1600 medicinal plants of Korea (Ahn, 2000) and 24% of plant lists recorded in the vegetation of Dadohae national park (Chonnam, 1995). A large number of species occurred although uninhabited islands were generally small in size.

The lists of medicinal plants classified by islands were arranged on Table 1 and 2. The 351 medicinal plants at Changjukdo (290,000m²) were recorded and is the largest flora among 22 islands, and 304 species at Sajado (102,600m²), 261 species at Kambudo (105,719 m²) according to size. Meanwhile, Wado (4,661m²) was recorded 61 species and is the lowest flora among 22 islands. These differences were considered to be related to island area and an experience of inhabited island.

In all surveyed islands, common species were *Pteridium aquilinum* var. *latiusculum*, *Imperata cylindrica* var. *koenigii*, *Themeda triandra* var. *japonica*, *Scilla scilloides*, *Smilax china*, *Carpinus coreana*, *Pueraria thunbergiana*, *Euonymus japonica*, *Eurya japonica*, *Rhododendron mucronulatum*, *Ardisia japonica*, *Trachelospermum asiaticum* var. *intermedium*, *Paederia scandens*, *Lonicera japonica*, *Aster scaber*, *Chrysanthemum boreale*, *Ixeris dentata*, and *Sonchus oleraceus*.

The 12 special medicinal plants investigated were grown generally in the islands of Southwestern sea; *Lemmaphyllum microphyllum*, *Dendropanax morbifera*, *Ficus erecta*, *Farfugium japonicum*, *Machilus thunbergii*, *Juniperus chinensis* var. *procumbens*, *Dendrobium moniliforme*, *Pyrrhosia tricuspidis*, *Cinnamomum japonicum*, *Pittosporum tobira*, *Kadsura japonica*, and *Daphniphyllum macropodium* (Ahn, 2000).

These results showed that medicinal plants in uninhabited islands were in abundance and the conservation of the vegetation of uninhabited islands are required from the destruction by grazing and

anglers.
