Key Words : 4-Methylene-2-cyclohexenones, Aromatization, Methoxymethyl anisoles, Baylis-Hillman acetates

Recently, we have reported on the synthesis of anisole derivatives from 4-alkylidene-2-cyclohexene-1-ones with iodine in methanol.¹ 4-Alkylidene-2-cyclohexene-1-ones could be synthesized from the reaction of Baylis-Hillman acetates and 2,4-pentanedione according to the reported procedure by Chamakh and Amri.²

We and other groups have reported the selective introduction of nucleophiles at the secondary benzylic position of the Baylis-Hillman acetates via the corresponding DABCO salts.³ Thus, we envisioned that we could prepare 4-methylene-2-cyclohexenone skeleton and *para*-methoxymethyl anisoles by combining the DABCO salt concept and the aromatization reaction with iodine in methanol.^{1,3} Suitably substituted anisoles are useful as the starting materials for the fragrances, dyes and pesticides, as antioxidants in oils and fats, or as stabilizers of plastics.⁴ Moreover, *para*-methoxymethyl anisoles have been used for the kinetic acetalization of diol or amino alcohol systems in the presence of DDQ⁵ during the synthesis of (+)-FR900482,^{5b} taxotere side chain,^{5c} cyclopropyl lactone oxylipins,^{5d} and erythromycin A.^{5e}

Our synthetic scheme for the synthesis of 4-methylene-2-cyclohexenone skeleton and *para*-methoxymethyl anisole is shown in Scheme 1 by using **4a** and **5a** as the representative examples. The reaction of the Baylis-Hillman acetate **1a** and DABCO in aqueous THF gave the corresponding DABCO

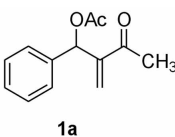

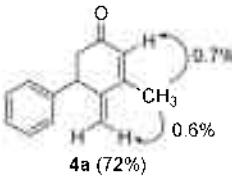

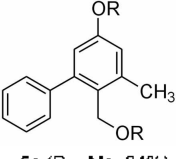

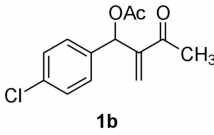

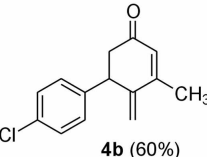

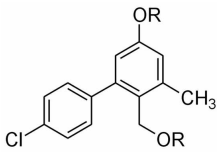

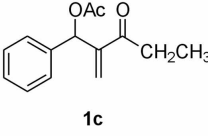

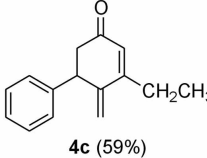

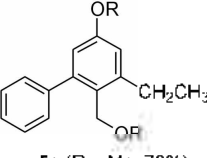

salt **2a** instantaneously as reported.³ The reaction of the DABCO salt **2a** and 2,4-pentanedione afforded the intermediate **3a** in moderate yield (44%). During the synthesis of **3a**, some side products were produced (including dihydropyran skeleton),⁶ which diminished the yield of **3a**. With the compound **3a** in our hand, we examined the next conversion toward 4-methylene-2-cyclohexenone **4a** by using the Amri's conditions (K₂CO₃ in ethanol)² and we could prepare 4-methylene-2-cyclohexenone **4a** in good yield (72%).⁷ The synthesis of **4a** was tried by using the modified conditions in order to improve the yield of **4a** as follows. In situ generation of the DABCO salt **2a** in ethanol and the following reaction with 2,4-pentanedione in the presence of K₂CO₃ gave **4a** in a similar isolated yield (47%) (Scheme 1).⁸ The use of ethyl acetoacetate instead of 2,4-pentanedione also gave **4a** in lower yield (not shown in Scheme 1). The structure of **4a** was confirmed as shown in Table 1 by NOE experiments. As an example, irradiation of the methyl group (δ = 2.11 ppm) of **4a** showed increments of the proton at the 2-position (δ = 6.00 ppm) and one of the methylene protons (δ = 5.51 ppm) in 0.6 and 0.7%, respectively. As the final step, the reaction of **4a** and iodine (1.1 equiv.) in methanol (40–50 °C) afforded methoxymethyl anisole **5a** in good yield (84%).⁹ Similarly, **5c** and **5e** were synthesized in good yields from **4b** and **4c**. As shown in Table 1, the use of ethanol as the solvent afforded the ethoxymethyl phenetole derivatives

In summary, we have developed an efficient synthetic methodology for the synthesis of 4-methylene-2-cyclohexenones, 4-methoxymethyl anisoles, and 4-ethoxymethyl phenetoles in moderate yields, starting from the Baylis-Hillman acetates.

Experimental Section

Typical procedure for the synthesis of 3a. To a stirred solution of the Baylis-Hillman acetate (**1a**, 436 mg, 2 mmol) in aq. THF (THF/H₂O = 3 : 1, 10 mL) was added DABCO (448 mg, 4 mmol) and stirred at room temperature for 15 min. To the reaction mixture 2,4-pentanedione (220 mg, 2.2 mmol) was added and stirred at room temperature for 24 h. After the normal aqueous workup and column chromatographic purification process (hexanes/ether, 4 : 1) pure **3a** was obtained, 228 mg (44%). Spectroscopic data of prepared compounds are as follows. **3a**: 44%; ¹H NMR (CDCl₃) δ 1.90 (s, 3H), 2.15 (s, 3H), 2.26 (s, 3H), 4.56 (d, *J* = 12.6 Hz, 1H), 4.90 (d, *J* = 12.6 Hz, 1H), 5.93 (s, 1H), 6.13 (s, 1H), 7.17-7.27 (m, 5H). **3b**: 25%; ¹H NMR (CDCl₃) δ 1.94 (s, 3H), 2.14 (s, 3H), 2.26 (s, 3H), 4.55 (d, *J* = 12.6 Hz, 1H), 4.88 (d, *J* = 12.6 Hz, 1H), 5.94 (s, 1H), 6.15 (s, 1H), 7.14-7.30 (m, 4H). **3c**: 45%; ¹H NMR (CDCl₃) δ 0.98 (t, *J* = 6.6 Hz, 3H), 1.89 (s, 3H), 2.15 (s, 3H), 2.50-2.70 (m, 2H), 4.57 (d, *J* = 12.6 Hz, 1H), 4.89 (d, *J* = 12.6 Hz, 1H), 5.86 (s, 1H), 6.09 (s, 1H), 7.15-7.28 (m, 5H); ¹³C NMR (CDCl₃) δ 8.04,
