The self-assembly of highly organized metalorganic frameworks comprised of metal ions as nodes and bridged ligands as spacers has achieved considerable progress in supramolecular chemistry and material chemistry. ${ }^{1.4}$ The increasing interest in this field is not only because of their intriguing variety of architectures and topologies, but also because of their potential applications as functional materials. ${ }^{5-9}$ By selecting appropriate metal ions and bridged ligands, coordination polymers with fantastic structures and desirable properties can be obtained. The dicarboxylato ligand and d-block metal ions have been extensively used in much of this work. ${ }^{10}$ The coordination polymers bearing dicarboxylato anion ligands have been shown to form a wide range of interesting network topologies, for examples, 1D chains, 2D open layers, and 3D diamondoid networks. ${ }^{11}$ In our ongoing investigation on the coordination chemistry of d-block metal(II) complexes containing diamine and/or dicarboxylate
anion, the monomeric title compound 1 was obtained by the reaction of phen and malonic acid with the $\mathrm{CoCO}_{3} \times \mathrm{xH}_{2} \mathrm{O}$. The crystal structures of some cobalt(III) complexes with phen and other ligands have been studied, such as $\left[\mathrm{Co}(\mathrm{phen})_{2} \mathrm{Cl}_{2}\right]-$ $\mathrm{Cl} \cdot 3 \mathrm{H}_{2} \mathrm{O},\left[\mathrm{Co}(\text { phen })_{2} \mathrm{CO}_{3}\right] \cdot \mathrm{X}\left(\mathrm{X}=\mathrm{Cl}, \mathrm{Br}, \mathrm{NO}_{3}\right.$, and $\mathrm{ClO}_{4}$ ). ${ }^{12}$ However, to our knowledge, trivalent cobalt complex with bicarbonate as counter ion in the formula is not known up to now. Thereby, we report here the preparation and structure of 1 .

## EXPERIMENTAL

Synthesis. All chemicals were commercially purchased and used without further purification. Elemental analyses ( $\mathrm{C}, \mathrm{H}, \mathrm{N}$ ) were performed on a Carlo Erba EA-1106 Elemental Analyzer. IR spectrum was recorded in the range $400-4000 \mathrm{~cm}^{-1}$ on a Mattson Polaris FT-IR Spectrophotometer using KBr pellets. The initial and final pH of the
reaction was measured using Sentron 1001 pH meter.

A mixture of $\mathrm{CoCO}_{3} \times \mathrm{H}_{2} \mathrm{O}(0.059 \mathrm{~g}, 0.5 \mathrm{mmol})$, $\mathrm{HO}_{2} \mathrm{CCH}_{2} \mathrm{CO}_{2} \mathrm{H}(0.052 \mathrm{~g}, 0.5 \mathrm{mmol}), 1,10-$ phen ( $0.180 \mathrm{~g}, 1.0 \mathrm{mmol}$ ), and water ( $9 \mathrm{ml}, 500 \mathrm{mmol}$ ) in the mole ratio $1: 1: 2: 1000$ was placed in a 23 ml Teflon-lined Parr acid digestion bomb and heated for 2 d at $150^{\circ} \mathrm{C}$ under autogenous pressure. After the mixture was removed from the oven and allowed to cool under ambient conditions for 3 d , the red needles of 1 suitable for X-ray diffraction were isolated in $20 \%(0.06 \mathrm{~g})$ yield based on cobalt. Initial $\mathrm{pH}, 4$; tinal $\mathrm{pH}, 5$. Anal. Calced. for $\mathrm{C}_{26} \mathrm{H}_{3} \mathrm{CoN}_{4} \mathrm{O}_{10}$ : C, 50.99 ; H, 4.11; N, 9.15 . Found: C, 50.92; H, 4.15; $\mathrm{N}, 9.18 . \mathbb{R}\left(\mathrm{KBr}\right.$ pellet, $\left.\mathrm{cm}^{-1}\right)$ : 3409(s), $1628(\mathrm{~m})$, $1565(\mathrm{~s}), 1517(\mathrm{~m}), 1422(\mathrm{~s}), 1385(\mathrm{~m}), 849(\mathrm{~m}), 724(\mathrm{~m})$, 646(m).

X-ray crystallography. X-ray diffraction data of the single crystal was collected at $293(2) \mathrm{K}$ on an ADSC Quantum 210 detector at Beam-line 4A MXW of Pohang Light Source. The crystal evaluation and data collection were done using $0.77001 \AA$ wavelength radiation with a detector-to-crystal distance of 6.0 cm . Preliminary cell constants and an orientation matrix were determined from 36 sets of frames collected at scan intervals of $5^{\circ}$ with an exposure time of 1 s per frame. The basic scale file was obtained from program HKL2000. ${ }^{13}$ The reflections were successfully indexed by the automated indexing routine of the DENZO program. A total of 29,499 reflections were harvested by collecting 72 sets of frames with $5^{\circ}$ scans with an exposure time of 1 second per frame. This highly redundant data set was corrected for Lorentz and polarization effects, and a (negligible) conection for crystal decay was also applied. The space group P-1 was determined by the program XPREP (ver. 6.12, Bruker-AXS). The structure was solved by direct method ${ }^{14}$ and refined on $F^{2}$ by full-matrix leastsquares procedures. ${ }^{1 s}$ All non-hydrogen atoms were refined using anisotropic themal parameters. Hydrogen atoms were included in the structure factor calculation

at idealized positions by using riding model, but not refined. A summary of the experimental and crystallographic data for compound $\mathbf{1}$ is presented in Table 1.

## RESULTS AND DISCLSSION

The hydrothermal reaction of $\mathrm{CoCO}_{3} \mathrm{XH}_{2} \mathrm{O}$, $\mathrm{HO}_{2} \mathrm{CCH}_{2} \mathrm{CO}_{2} \mathrm{H}, 1,10$-phen, and water in the nole ratio 1:1:1:1000 at 150 for 2 d yielded the title compound in $20 \%$ yield as red needles. The nalonic acid present in the initial reaction mixture was not found in the crystalline product. It is not uncommon for necessary reactants in hydrothermal processes to be absent from the product, while their specific role in complexation remains elusive. ${ }^{16}$ It may be that malonic acid acts to form the bicarbonate ion $\left(\mathrm{HCO}_{3}^{-}\right) .{ }^{17}$ The formal valence of cobalt atom on

(a)

(b)

Fig. I. (a) ORIFI] tepresentation of the complex. [Co(phet) $(\mathrm{CO}, \mathrm{O}]-$, $\mathrm{H}_{2} \mathrm{CO}_{3}-4 \mathrm{H}_{2} \mathrm{O}$ at $30 \%$ probability and (b) packing digram showing the hydrgen bonds in the unit cell (hydrogen atoms were omitied for clarity).
the basis of overall charge consideration in the formula is $\mathrm{Co}(\mathrm{III})$. The oxidation state is conformed from bond valence calculations. ${ }^{18}$
As shown in Fig. 1(a), the structure of 1 contains a six-coordinated cobalt atom chelated by 1 wo phen ligands and one carbonate anion. The cobalt
center has a distorted octahedral geometry and is surrounded by four nitrogen atoms of two phen ( $\mathrm{N}(1)$ - $\mathrm{N}(4)$ ) and the two oxygen atoms of carbonato ligand, $O(1)$ and $O(2)$. The bite angles of phen and carbonato chelate rings to the cobalt atom are ca. $83.79(9)^{\prime \prime}$ and $69.63(8)^{\prime \prime}$, respectively, which are almost the same with other complexes. ${ }^{12}$ The small bite of the $\mathrm{CO}_{3}{ }^{2-}$ ligand produces a significant distortion from a regular octahedron, with other angles also deviating from 90 or $180^{\circ}$ (Table 2). Cobalt-nitrogen bond distances (Co-N1 1.938(2), Co-N2 $1.962(2) \AA$ ) are in agreement with $1.936(15) \AA$ found in $\left.\left[\mathrm{Co}\left(\mathrm{NH}_{3}\right)_{6}\right]_{3}\right]^{19}$ It is also known that a $\mathrm{Co}-\mathrm{N}$ bond distance of approximately 1.9 A is characteristic of $\mathrm{Co}(\mathrm{III})$ and is about $0.18 \dot{\mathrm{~A}}$ shorter then the corresponding distance in Co (II) complexes. ${ }^{210}$ The bond distances of $\mathrm{Co}-\mathrm{N} 2$ and $\mathrm{Co}-\mathrm{N} 4$ which are trons to the carbonato ligand are slightly longer than those of $\mathrm{Co}-\mathrm{NI}$ and $\mathrm{Co}-\mathrm{N} 3$ which are cis to the carbonato ligand. This can be interpreted on the basis of the trans effeet to oxygen atoms of carbonato ligand. The $\mathrm{Co}-\mathrm{O}$ bond distances (ca. $1.89 \AA$ ) of carbonato ligand are consistent with bidentate coordination found in the other [Co(phen)-$\left.\left(\mathrm{CO}_{3}\right)\right]^{\text {. }}$ structures. ${ }^{12}$ The $\mathrm{C}-\mathrm{O}$ bond distances of carbonato ligand reveal two longer $\mathrm{C}-\mathrm{O}_{\text {cturs }}$. bonds

| $\bigcirc(3)-C(25)-O(2)$ | 125.6(3) | O(1)-C(25)-O(2) | 109.5(2) |
| $\bigcirc(4)-\mathrm{C}(26)-\mathrm{O}(5)$ | 120.7(6) | $O(4)-C(26)-O(6)$ | 120.8(5) |
| O(5)-C.(26)-O(6) | 118.4(5) |  |  |

(ca. $1.322(3) \AA$ ) and the shorter $\mathrm{C}-\mathrm{O}_{\text {urcoond }}$ bond $(1.223(3) \AA)$. The two coordinated oxygens have more single bond character than the unbound oxygen. Thus, this result is not at all surprising. However, the shorter bond distances of $\mathrm{C}-\mathrm{O}$ $(1.153(6)-1.209(6) \AA)$ in the bicarbonate acting as a counter ion are distinguished from those of carbonato ligand. The bond disatance of C26-06 $(1.209(6) \AA)$ is longer than those of C26-O4 (1.153(6) $\AA$ ) and $\mathrm{C} 26-\mathrm{O} 5(1.193(5) \AA$ ), indicating that the oxygen atom, 06 is protonated. The rest of the $\mathrm{C}-\mathrm{N}$ and $\mathrm{C}-\mathrm{C}$ bond distances of the phen ligand are all considered normal and agree well with those found in other complexes. ${ }^{100}$ The mononuclear structure of $\mathbf{1}$ is further expended through weak hydrogen bonds between carbon atoms of 1,10 -phen ring and oxygen atoms of uncoordinated water ( $\mathrm{C} 2-\mathrm{H} 2 \cdots \mathrm{Ol} 0 \mathrm{~d}(\mathrm{D} \cdots \mathrm{A})=$ $3.512(4) \AA<(\mathrm{D}-\mathrm{H} \cdots \mathrm{A})=175^{\circ}, \mathrm{Cl} 2-\mathrm{H} 12 \cdots \mathrm{O} 9 \AA$ $\mathrm{d}(\mathrm{D} \cdots \mathrm{A})=3.264(4) \AA<(\mathrm{D}-\mathrm{H} \cdots \mathrm{A})=141^{\circ}$, and $\mathrm{C} 24-$ $\mathrm{H} 24 \cdots \mathrm{O} 10(1-\mathrm{x}, 1-\mathrm{y}, 1-\mathrm{z}) \mathrm{d}(\mathrm{D} \cdots \mathrm{A})=3.270(4) \AA$ $\angle(\mathrm{D}-\mathrm{H} \cdots \mathrm{A})=134^{\circ}$ ) or bicarbonate ions (C3-H3 $\cdots \mathrm{O} 4 \mathrm{~d}(\mathrm{D} \cdots \mathrm{A})=3.214(6) \AA \angle(\mathrm{D}-\mathrm{H} \cdots \mathrm{A})=164^{\circ}, \mathrm{C} 14-$ $\left.\mathrm{H} 14 \cdots \mathrm{O} \mathrm{d}(\mathrm{D} \cdots \mathrm{A})=3.316(6)) \AA \leq(\mathrm{D}-\mathrm{H} \cdots \mathrm{A})=137^{\circ}\right)$, respectively. In addition, there is two types of intramolecular hydrogen bonds between carbon atoms of 1,10 -phen ring and oxygen atoms of carbonate ion $(\mathrm{C} 1-\mathrm{Hl} \cdots \mathrm{Ol} \mathrm{d}(\mathrm{D} \cdots \mathrm{A})=2.928(3) \AA$ $\angle\left(\mathrm{D}-\mathrm{H}^{\cdots} \cdot \mathrm{A}\right)=110^{\circ}$ and $\mathrm{C} 13-\mathrm{H} 13 \cdots \mathrm{O} 2 \mathrm{~d}\left(\mathrm{D}^{\cdots} \mathrm{A}\right)$ $\left.=3.002(3) \AA \angle\left(\mathrm{D}-\mathrm{H}^{\cdots} \cdot \mathrm{A}\right)=109^{\circ}\right)$. The packing diagram showing hydrogen bonds is shown in Fig. 1(b).
The IR spectrum of the title compound show characteristic band at $1628 \mathrm{~cm}^{-1}$ for the $\mathrm{C}=0$ stretching vibration. The absence of the carbonyl peak near $1700 \mathrm{~cm}^{-1}$ for the carbonic acid indicates the presence of carbonate and/or bicarbonate ion in the formula. ${ }^{21}$ The strong absorption band at $3409 \mathrm{~cm}^{-1}$ is assigned to the $v(\mathrm{OH})$ of uncoordinated water molecules.
In conclusion, we have synthesized a new title compound $\left[\mathrm{Co}(\text { phen })_{2}\left(\mathrm{CO}_{3}\right)\right] \cdot\left(\mathrm{HCO}_{3}\right) \cdot 4 \mathrm{H}_{2} \mathrm{O}$ from the reaction mixtures of $\mathrm{CoCO}_{3} \cdot \mathrm{xH}_{2} \mathrm{O}, \mathrm{HO}_{2} \mathrm{CCH}_{2} \mathrm{CO}_{2} \mathrm{H}$,

1,10 -phen, and water by hydrothermal reaction. It is noteworthy that the complex is the first example of cobalt(III) complex with both carbonate and bicarbonate ion in the crystal structure.

Supplementary materials. Crystallographic data for the structure reported here have been deposited with the Cambridge Crystallographic Data Centre (Deposition NO. CCDC-647828). The data can be obtained free of charge via www.cedc.canı.ac.uk/ data request/cif.

Acknowledgement. X-ray data was obtained from the Pohang Light Source, Rep. of Korea. We thank the staff at beanuline 4A MXW of Pohang Light Source for assistance during data collection.
