요 약. Thioureaurea, 다양한 aromatic aldehydes, ammonium acetate의 세가지 요소를 가.지고 마이크로파의 조 사하에서 무수조건외 활성화된 비산화재를 촉매로 사용하여 높은 수율의 6-ayyl-1,2,4,5-tetrazinan-3-thiones/ones를 얻었 다. 6-aryl-1,2,4,5-tetrazinan-3-thiones/ones의 구조는 녹는점, MS, IR, ${ }^{1} \mathrm{H} \operatorname{NMR}, \mathrm{D}_{2} \mathrm{O}$ 교환, ${ }^{13} \mathrm{C}, \mathrm{NMR}$, 이차원의 NMR 스펙트럼(HOMOCOR, HSQC )을 바탕으로 증명되었다.

주제어: 활성화된 비산회, 6-alyl-1,2,4,5-tetazinan-3-thiones/ones, one-pot 합성, 다성분 반응. 무수조건

#### Abstract

Three-component coupling of thiourea/urea, various structurally diverse aromatic aldehydes and ammonium acetate is catalyzed by activated fly ash in dry media under microwave irradiation to give 6 -aryl-1,2,4,5-tetrazinan-3-thiones/ones in good yields. The structure of 6 -aryl-1,2,4.5-tetrazinan-3-thiones/ones have been elucidated on the basis of their melting points, elemental analysis, MS, $\mathbb{R}$, ${ }^{\prime} \mathrm{H}$ NMR, $\mathrm{D}_{2} \mathrm{O}$ exchange. ${ }^{13} \mathrm{C}$ NMR and two dimensional NMR spectral studies including Homonuclear Comelation (HOMOCOR) and Heteronuclear Single Quantum Comelation (HSQC) spectra.

Keywords: Activated Fly Ash, 6-alyl-1,2,4,5-tetrazinan-3-thiones/ones, 'one-pot' Synthesis, Multicomponent Reaction. Dry Media

## INTRODCCTION

Organic compounds with a high-nitrogen content currently attract significant attention from many researchers, due to their novel energetic properties .: 1,2,4,5-Tetrazines have, however, been very widely utilized for the highly effective synthesis of natural products, bioactive compounds, ligands, highly energetic materials, building blocks, diazocinones, imidazoles, alkylidene-/arylidenemalonalde-
hydes, acrylic acid derivatives, pyrazoles and polycyclic aromatic compounds. ${ }^{3}$ Since the formation of $N-N$ bond is relatively difficult, $1,2,4,5$-tetrazines were generally prepared form hydrazine derivatives or from nitrilimines. A number of mono hydrazones of simple aldehydes and ketone with thiocarbohydrazide and 6-alkylhexahydro-1,2,4,5-tetrazinan-3-thiones have been reported. ${ }^{+}$In this report, orly aliphatic aldehydes gave $1,2,4,5$-tetrazines. But benzaldehyde gave only true monohy-
drazone with thiocarbohydrazide.
11 has been about 70 years to research and use fly ash. With its application, the action mechamism of fly ash had been recognized. During the initial stage, only its pozzolanic activity is paid attention. ${ }^{5.6}$ Many researchers devoted themselves to the rescarch of the potential activity of fly ash and the hydration process of Hly ash cement. ${ }^{7}$ Recently activated fly ash is used to catalyze Knoevenagel condensation, 'One-Pot' conversions of ketones to amides via, Beckmann rearrangement, Schilf Bases formation. Biginelli and llanksch reactions. ${ }^{8}$ Owing to our interest in solid-state reactions. ${ }^{7}$ we attempted to use activated lly ash to catalyze threc-component coupling of thiourea/urca, various structurally diverse aromatic aldehydes and ammonium acetate to form 6-aryl-1,2,4,5-tetrazinan-3-thiones/ones, which possess antimicrobial activity. ${ }^{\text {(4) }}$

## RESULTS AND DISCUSSION

The fly ash collected from Neyveli Lignite Corporation, Neyveli, Tamil Nadu, India was utilized for catalyzing the reactions. The physical properties, such as specific gravily and specific surface area, of fly ash used were 1.9 and $127 \mathrm{~m}^{2} / \mathrm{g}$, respectively. The chemical compositions (\%) of fly ash [7a] used were $\mathrm{SiO}_{2}, \mathrm{Ic}_{2} \mathrm{O}_{3}, \mathrm{Al}_{2} \mathrm{O}_{3}, \mathrm{CaO}, \mathrm{MgO}$, loss of ignition, insoluble residue in the ratio $64.03,6.50$, $15.50,4.62,3.00,4.35,2.00$ respectively.
The purpose of the present investigation is to activate the as-received fly ash by physical method followed by thermal method (Fig. 1) and to study the influence of activated fly ash to catalyze threecomponent coupling of thiourea/urea, various structurally diverse aromatic aldehydes and ammonium acelate to form 6-aryl-1,2,4,5-tetrazinan-3-thiones ones. Activated lly ash was shown to be one of the most efficient MW absorbers with a very high specificity to MW heating. It was able to reach a tenperature of $135^{\circ} \mathrm{C}$ after 6 minutes of irradiation in domestic oven. ( $\mathrm{P}-320 \mathrm{~W}$ ). During the coarse of reaction, the catalyst assists in the release of hydrogen molecules. The amount of hydrogen molecule released is in very low concentration. Since all the

Fig. 1. Flow chart for the prepuration of wetivaled fly ash.
reactions are conducted in open vessels, the released hydrogen molecule escapes. Moreover, the catalyst assists in the removal of water molecules. Thus activated Fly ash catalyst assists for dehydrogenation and dehydration.
'One-pot' multicomponent cyclocondensation reaction of one mole of thiourea urea, one mole of substituted benzaldehyde and two moles of ammonium acetate in the presence of activated fly ash yields 6-aryl-1,2,4,5-tetrazinan-3-thiones/ones in dry media under microwave irradiation (Scheme 1).

The structure of 6 -aryl-1,2,4,5-tetrazinan-3-thiones/ ones have been elucidated on the basis of their melting points, elemental analysis. MS, IR. 'II NMR, $\mathrm{D}_{2} \mathrm{O}$ exchange, ${ }^{13} \mathrm{C}$ NMR and two dimensional NMR spectral studies including I Iomonuclear Correlation (11OMOCOR) and Heteromuclear Single Quantum Correlation (IlSQC) spectra. The mechanistic pathway is given in Scheme 2.

Spectral analysis reveals the existenee of two isomeric structures of 6-aryl-1,2,4,5-tetrazinan-3-thiones/ ones, which is due to different conformations in solution. Unlike carbocyclic six membered systems, the tetrazines, which have four nitrogen atoms including four lone pairs, expected to exists in non-chair conformations due to lone pair-lone pair interactions. Among these confomations, the phenyl group occupies axial like or equatorial like orientation. Due to

Sehente 1. Synthesis of 6-aryl-1,2,4,5-tetrazinan-3-thiones/ ones calalyzed by activaled Iy ash.

Scheme 2, Mechanistic pathway for the lonmation of 6 -phe-nyl-1,2,4,5-terazinan-3-mes/hiones.
nitrogen quadrapole eflect, it is difficult to calculate the coupling constant between the protons attached to nitrogen atoms. The coupling constant of proton attached to nitrogens and H-6 is only measurable, we expected triplet or double-doublet for $\mathrm{H}-6$ protons. But only two separate doublets are observed. This clearly indicates that $\mathrm{N}-1$ proton or $\mathrm{N}-5$ proton is coupled with $\mathrm{H}-6$ proton. The phenyl group, which occupies equatorial like orientation, has $\mathrm{N}-5$ proton couple with [1-6 proton, but N-I proton does not couple with I-6 proton (the dihedral angle is nearly $90^{\circ}$ ). The phenyl group, which cecupies axial like orientation, have $\mathrm{N}-5$ proton does not couple but N-1 proton couple with [1-6 proton. The above spectral analysis reveals that existence of two isomers. Between the two isomers, one isomer with phenyl ring in equatorial like is major and phenyl ring in axial like orientation is minor.

## EXPERIMENTAL

## General Remarks

All the organie reagents used were pure commercial products. Performing TLC assessed the reactions and the purity of the products. All the reported melting points were taken in open capillaries and were uncorrected. IR speetra were recorded in KBr (pellet forms) on a Nicolet-Avatar-330 IFT-LR spectrophotometer and note worthy absorption values ( $\mathrm{cm}^{-1}$ ) alone are listed. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ N.MR spectra were recorded at 400 MHz and 100 MHz respectively on Bruker AMX 400 NMR spectrometer
using DMSO as solvent. Homonuclear Correlation (llOMOCOR) Spectrum and Heteronuclear Single Quantum Correlation (ISQC') spectrum were recorded on Bruker IDRX 500 NMR spectrometer using standard parameters. The ISSI +ve MS spectra were recorded on a Bruker Daltonics L.C-MS spectrometer. Satisfactory microanalysis was obtained on Carlo Erba 1106 CHN analyzer. A conventional (ammodiflecf) domestic microwave oven equipped with a turntable (LG, MG-395 WA, $230 \mathrm{~V}-50 \mathrm{HL}, 760 \mathrm{~W}$ ) was used for the irradiation.

General experimental procedure for the 'one pol' synthesis of 6-aryl-1,2,4,5-tetrazinan-3-thiones/ones catalyzed by activated fly ash under microwave irradiation (entries 1-14): A mixture conlaining thioureaiurea ( 10 mmol), substituted benzaldehyde ( 10 mmol ), ammonium acetate ( 20 mmol ) and activated fly ash ( 150 mg ) was added in an alumina bath and mixed properly with the aid of glass rod (10s) and then irradiated in a microwave oven for the appropriate period of time as mentioned in Table 1 at 320 W (monitored by TLC). After completion of the reaction, the reaction mixture was extracted with ethyl acetate ( $3 \times 10 \mathrm{~mL}$ ). The catalyst was removed by filtration. The combined organic layer was washed with water three times and then dried over ambydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The organic layer was coneentrated in vacuo to furnish the products, which were purificd by column chromatography using ethyl acetate: petrolcum ether ( $40: 60$ ) $[2: 8]$ as eluent.

## CONCLUSION

The eye-catching features of this synthetic procedure are the mild reaction conditions, high conversions, cleaner reaction profiles, solvent-free reaction conditions, operational simplicity and inexpensive and readily available Fly ash, an industrial waste (pollutant), which act as a catalyst will make it a
useful strategy for the preparation of novel 6-aryl-1,2,4,5-tetrazinan-3-thiones/ones. Developments of further works are in progress in these directions.
