Key Words: Container molecule, Carceplex, Functionalization, Supramolecule

The selective functionalizations of container molecules are important tasks to expand its research fields. In case of covalent-bonded container molecules based on resorcin[4]arene their functionalization methods are quite limited compared to those for molecular capsules or calixarenes.
The functionalizations on tropical region of resorcin[4]-arene-based container molecules with $D_{4 \mathrm{~h}}$ symmetry have been usually accomplished by applying functionalized bridging reagent at the final convergent shell-closing step, which were successful for the manipulation of intrinsic properties of cavity, ${ }^{1}$ the solubility control. ${ }^{2}$ or the incorporation of metal ligands for multidimensional assembly of host. ${ }^{3}$ The step-wise shell-closing reactions were also successful for $C_{4 v}$ or less symmetric carceplexes, ${ }^{+}$hemicarceplexes ${ }^{5}$ or cavitands ${ }^{6}$, which are mostly functionalized on their tropical regions.
The homogeneous four-feet functionalizations of $C_{4 v}$ resorcin[4]arene gave various functional container molecules such as monolayer of carceplex. ${ }^{76}$ metal-coordinated oligomers, ${ }^{7 \mathrm{c}}$ and water soluble molecular capsules. ${ }^{7 \mathrm{~d}}$ Especially the selective monofunctionalization methods on a foot ${ }^{8 \mathrm{a}, \mathrm{b}}$ of
resorcin[4]arene gave the important intermediates for the new kinds of self-assemblies such as $\pi-\pi$ stacked oligomers, ${ }^{8 b, 94}$ star-shaped supramolecular polymer, ${ }^{9 b}$ and selfsorting hexameric capsules. ${ }^{\text {W }}$ Here are reported carceplexes 6 and 7 having a $p$-bromophenyl foot which can be used as a platform for the molecular engineering of carceplexes.

The key compound 1, p-bromophenyl tetramethyloctol, was obtained by the hetero condensation among 2-methylresorcinol, 4-bromobenzaldehyde, and octanal in about $40 \%$ yield. ${ }^{87}$ Tetramethylcavitand 2 was obtained in $33 \%$ yield by the 4 -fold intramolecular cyclization of octol 1 using $\mathrm{CH}_{2} \mathrm{BrCl}$ and $\mathrm{K}_{2} \mathrm{CO}_{3}$. Tetramethylcavitand 2 was converted to $p$-bromophenyl tetrakis(bromomethyl)cavitand $\mathbf{3}$ by NBS/ AIBN in $42 \%$ yield.

The shell-closing reaction between $p$-bromophenyl tetrakis(bromomethyl)cavitand $\mathbf{3}$ and tetrakis(thiomethyl)cavitand $\mathbf{4}$ in a mixture of methyl ethyl ketone (MEK) or $N, N$-dimethylformamide (DMF) and $\mathrm{Rb}_{2} \mathrm{CO}_{3}$ gave MEK@carcerand 5 (carceplex 6) or DMF (abcarcerand 5 (carceplex 7) in $56 \%$ and $25 \%$ yield, respectively. The structures of MEK $(\bar{a}$ carcerand 5 and $\operatorname{DMF}$ (acarcerand 5 were characterized with

## MALDI TOF Mass and ${ }^{l} \mathrm{H}$ NMR spectrometry.

Carceplexes 6 and 7 have a US football-shaped cavity whose dimensions are roughly $11 \AA \times 6 \AA$. The complexed linear guest tends to orient through the long axis of cavity in which guest's terminal hydrogen nests deep into the two poles of host where the magnetic shielding effects from the four benzene units are overlapped. Table 1 shows the chemical shift changes of hydrogens of incarcerated guests. MEK is more linear compared to DMF, so the terminal methyls of MEK nest proximal to the poles to give the two largest $\Delta \delta$ of 3.99 and 4.07 . The larger $\Delta \delta$ of $\mathrm{H}_{\mathrm{c}}, 4.07$, than that of $\mathrm{H}_{\mathrm{a}}, 3.99$, is also due to their steric effect difference.
Such intrinsic properties of monomeric carceplexes have been extensively studied, ${ }^{1}$ but the studies on the cooperative multi-properties of dimer, oligomer, network, micelle, or membrane of container molecules are yet left to be explored. Figure 1 shows a prototypical biscarceplex 8, two different carceplexes connected through a oligophenylene foot, which can be obtained from carceplexes 6,7 , or their analogues. The interactions between two incarcerated guests through oligophenylene bridge would change the electric or magnetic properties and the redox potentials, which could influence the relative orientational preferences or the stabilities of incarcerated guests. Such an interesting study will open a new era of supramolecular chemistry.

## Experimental Section

Materials and General Procedures. All chemicals were reagent grades and directly used unless otherwise specified. All anhydrous reactions were conducted under an argon atmosphere. Melting points were determined using an Electrothermal LA9100 apparatus without calibration. MALDI-TOF

Mass spectra were run on a Voyager-DE ${ }^{\mathrm{TM}}$ STR Biospectrometry at National Center for Inter University Research Facilities (Seoul National University). The ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Brucker Avance ( 400 MHz ) spectrometer in $\mathrm{CDCl}_{3}$ unless stated otherwise. Gravity column chromatography was performed on silica gel 60 (E. Merck, 70-230 mash ASTM).
p-Bromophenyl Tetramethylcavitand 2. A mixture of octol 1 ( $10 \mathrm{~g}, 10 \mathrm{mmol}$ ), $\mathrm{CH}_{2} \mathrm{BrCl}(3.4 \mathrm{~mL}, 50 \mathrm{mmol})$, $\mathrm{K}_{2} \mathrm{CO}_{3}(8.5 \mathrm{~g})$, and DMF ( 50 mL ) was stirred at $50{ }^{\circ} \mathrm{C}$ overnight. The mixture was partitioned between 3 NHCl $(100 \mathrm{~mL})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$, and the organic phase was separated, washed with $3 \times \mathrm{HCl}$, brine, and then dried over $\mathrm{MgSO}_{4}$. The solvent was evaporated and the residue was purified by silica gel chromatography using a mixture of $\mathrm{EtOAc} /$ Hexane $(1: 11)$. The best fractions were collected, concentrated, and the residue was recrystallized in a mixture of $\mathrm{CH}_{3} \mathrm{CN} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ to give a product ( $3.5 \mathrm{~g}, 33 \%$ ); mp 145 $148{ }^{\circ} \mathrm{C}$; MALDI TOF MS $\mathrm{m} / \mathrm{z} \quad 1041.58\left(100 \%, \mathrm{M}^{+}\right) ;{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 0.86\left(9 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{3}\right)$, 1.25-1.52 (30H, m, CH2 $\left.\left.\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right), 1.97(6 \mathrm{H}, \mathrm{s}, \mathrm{ArCH})_{3}\right)$, $2.02(6 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}), 2.11\left(6 \mathrm{H}, \mathrm{bs}, \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right) \leqslant \mathrm{CH}_{3}\right), 4.22$ $(1 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}$, inner $\mathrm{OCH}, \mathrm{O}), 4.28(2 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}$, inner $\left.\mathrm{OCH}_{2} \mathrm{O}\right), 4.33\left(1 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz}\right.$, inner $\left.\mathrm{OCH} \mathrm{O}_{2} \mathrm{O}\right), 4.75$ $(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}$ methine $), 5.91\left(4 \mathrm{H}, \mathrm{m}\right.$, outer $\left.\mathrm{OCH}_{2} \mathrm{O}\right), 6.34$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}$ methine), 6.86 and 6.95 (two 2 H , two s, $\mathrm{Ar} H$ ), 7.29 ( $2 \mathrm{H}, \mathrm{d}, J=8.2 \mathrm{~Hz}, p$-bromophenyl), 7.49 ( $2 \mathrm{H}, \mathrm{d}, J=8.2$ Hz, p-bromophenyl); ${ }^{13} \mathrm{C} \times \mathrm{MR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 9.4$, $9.5,13.2,13.3,21.8,21.9,27.0,27.3,28.5,28.7,28.8,29.0$, $29.3,30.9,31.1,36.1,36.2,41.3,97.7,116.8,119.3,119.7$, $122.8,123.3,130.2,135.8,137.0,137.2,139.0,152.3,153.1$.
