ABSTRACT

The purpose of this study is to identify insects inhabiting Mulyeongari-Oreum wetland and to provide basic information for conservation of wetlands. As a result, a total 229 species, 73 families, 9 orders of insects were collected: 136 species, 39 families, 6 orders from Mulyeongari-Oreum Wetland and 121 species, 52 families, 9 orders from Mt. Sooryeong. Of the 229 species of insects investigated, *Copris tripartitus* Waterhouse, an endangered species of wildlife fauna in Korea, was found with many individuals. Also, *Lychnuris rufa*(Olivier), having a narrow habitat near unpolluted water and mountains, was also recorded with 3 individuals and then should be considered as a protected species in Wetlands. To identify the community structure of moth on Mulyeongari-Oreum wetland, a light trap was examined and a total 76 species of moths were collected. Total dominant species was *Hydrillodes morosa*(Butler) with index of 0.12 and the species diversity on the moth community from survey area was the highest in July with index of 3.42.

KEY WORDS: INSECT DIVERSITY, MULYEONGARI-OREUM WETLAND, RAMSAR CONVENTION

요약

본 논문은 물영아리오름 습지에 서식하는 곤충류를 파악하여 습지 보전에 대한 기초적인 정보를 제공하고자 실시되었다. 조사결과 총 9목 73과 229종이 조사되었으며, 물영아리오름 습지는 6목 39과 136종, 수령산은 9목 52과 121종이 조사되었다. 조사된 229종의 곤충류 중 멸종위기종인 애기뿔소똥구리가 포함되었다. 또한 오염되지 않은 습한 산 주위에서 주로 서식하는 늦반딧불이가 3개체 조사되었으며 이는 청정지역임을 나타내는 대표적인 종으로 습지에서 보호되어야 할 가치가 있는 것으로 판단된다. 또한 물영아리오름 습지의 나방류 확인을 위해 야간 유인등 조사를 실시하였으며 조사 결과 총 76종이 조사되었다. 넓은띠담흑수염나방이 0.12의 우점도 지수로 전체 우점종으로 조사되었으며, 종다양

INTRODUCTION

Although wetlands occupy only about 4% of the total surface of the earth(Hunter *et al.*, 2002), they are recognized to have significant functions of high value. With this recognition, people came to have interest in and to pay attention to the preservation of wetlands, with results such as the Ramsar Convention. Wetlands are defined as those with high water content in the soil(Gove, 1969). They are known to have high primary productivity and to have critical roles in the life cycles of many aquatic species, many of which are economically important(National Research Council, 1992). They also serve life support functions including adjustment of water flow and storage of excesses, mitigating damage by floods. In addition, plant and bacterial species of wetlands serve to remove contaminants from circulating water and thus improve water quality(National Research Council, 1992). In the Wetlands Conservation Act of Korea, they are defined as inland and coastal land which is permanently or temporarily covered with fresh water, brackish water or salt water(Lee *et al.*, 2003).

Mulyeongari-Oreum Wetland is located in Sumang-ri, Namwon-eup, Seogwipo-si, Jeju-do, South Korea. It is classified as inland wetland, specifically forest wetland, and more specifically basin wetland(Kwon, 2006). It was designated as a Wetlands Conservation Area in December, 2000 by the Ministry of Environment and registered as the fifth Ramsar Wetland in Korea in October, 2006. Based on its geographical condition, within the secluded mountaintop crater of Mt. Sooryeong, it is considered an independent ecosystem. There are always some wet parts in the wetland all year round, although conditions within specific areas vary according to the season. The natural environment of the area is excellent, with abundant vegetation that provides a variety of microhabitats. It is considered to have high conservational value.

Regarding the insects of the Mulyeongari-Oreum Wetland, Cho and Kim(1988a) and Cha(1999) reported 41

species and 26 species, respectively, for a total of 47 species up to now. These surveys were performed before the existence of the Ramsar Convention. From this perspective, this survey is highly meaningful in that it is the first survey since the Ramsar Convention. There are other surveys on the other Ramsar Registered Wetlands in Korea such as the High Moor, Yonneup of Mr. Daeam(Kim and Jung, 2007), Upo Wetland(Lee and Oh, 2006), Muljangori-oreum Wetland(Cho and Kim, 1998a; Jung, 2001), Moojechineup(Lee, 1997; Cho and Kim, 1998b; Do *et al.*, 2002; Lee and Lee, 2006), Jangdo Island High Moor(Kim, 2004; Paek and Song, 2007) and Du-ung Wetland(Cho and Kim, 2002).

This survey of the insects inhabiting Mulyeongari-Oreum Wetland and its supporting area on Mt. Sooryeong was performed to provide basic information for preservation and recovery of Mulyeongari-Oreum Wetland as part of the Mulyeongari-Oreum Wetland Precision Survey Project by the Ministry of Environment.

MATERIALS AND METHODS

1. Place and Time of Survey

Surveys were performed separately in Mulyeongari-Oreum Wetland(N: $33^{\circ} 22' 57''$, E: $126^{\circ} 42' 42''$) and its supporting area on Mt. Sooryeong(N: $33^{\circ} 21' 21''$, E: $126^{\circ} 41' 11''$)(Figure 1). They were performed three times: April 28 to 30, July 17 to 19 and September 30 to October 2, for a total of nine days, in 2008. All specimens are preserved in the laboratory of animal taxonomy and ecology in Daejeon University.

2. Method of Survey and Analysis

As insects have diversified habitats and behavioral habits, we used as many different collection methods as possible, according to the characteristics of the adults of each taxonomic group. For daytime collection, searching, sweeping and beating were adopted and qualitative

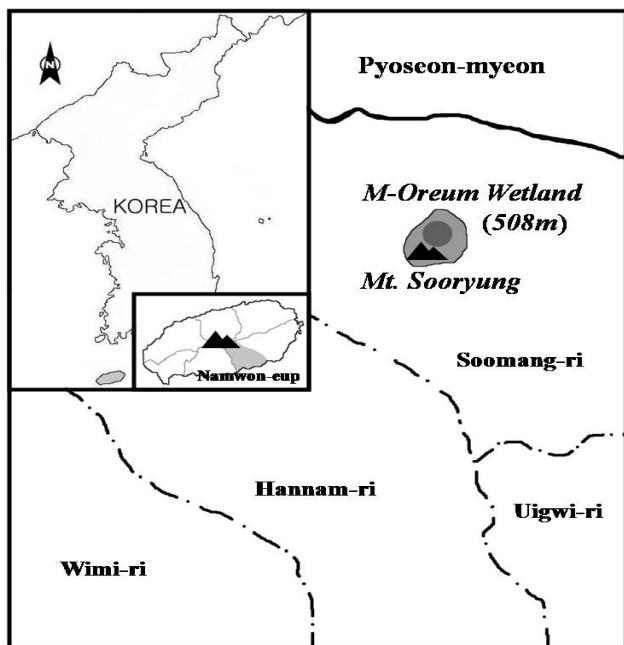

Figure 1. Survey area

surveys were done for various taxonomic groups. At night, to identify the community of moths, light trap quantitative surveys were done seasonally from 20:00 to 24:00 hours, to make three times in total. Additionally, to make a qualitative survey of the ground beetles in the wetland, pitfall trap was performed using silkworm pupae.

The insects collected in the field were temporarily anesthetized and then transported to the laboratory. Some were made into dried specimens and the others were made into immersion specimens in 70% ethanol. The collected insects were classified based on the previous literature and articles, and followed the classification scheme in "Checklist of Insects from Korea(1994)".

Moths were analyzed using dominance index and diversity index. For dominance index, McNaughton's

formula(1967) was used. For diversity index, Shannon-Weaver Diversity(1949) was used to create a baseline for comparison in the future.

RESULTS AND DISCUSSION

1. Total Taxonomic Groups

From the surveys, a total of 483 individuals belonging to 136 species, 39 families and 6 orders of adult insects were collected from Mulyeongari-Oreum Wetland and a total of 283 individuals, belonging to 121 species, 52 families and 9 orders of insects were collected from Mt. Sooryeong. The most species were reported in July for both Mulyeongari-Oreum Wetland and Mt. Sooryeong, 74 species and 77 species, respectively. In April, relatively smaller number of species were reported, 46 species and 18 species respectively(Table 1).

In the earlier Mulyeongari-Oreum Wetland surveys, Cho and Kim(1998a) reported 41 species, 22 families in 5 orders, while Cha(1999) reported 26 species, 14 families in 5 orders, for a total of 47 reported species. A considerable number of the reported insects were aquatic(18 species, approximately 40%) and the surveys were somewhat biased toward certain taxonomic groups because of the characteristics of the wetland. However, in this survey we were able to add approximately 90 species using the seasonal surveys in spring, summer and autumn and through a wider variety of collection methods for Lepidoptera and Coleoptera. Additionally, Mt. Sooryeong, which has not been surveyed before, and which has significant meaning in biology and ecology as it supports and nurtures Mulyeongari-Oreum Wetland was included in this survey. In Muljangori-Oreum, another Ramsar Wetland on Jeju Island, Cho and Kim(1998a) reported 31 species, 20

Table 1. Species composition of investigated areas

Site	Season	Order	Family	Species	Individuals
Mulyeongari-Oreum Wetland	April	4	16	46	157
	July	5	23	74	197
	October	4	22	49	129
	Total	6	39	136	483
Mt. Sooryeong	April	3	7	18	15
	July	8	38	77	153
	October	9	31	60	115
	Total	9	52	121	283

families in 7 orders and Jung(2001) reported 182 species, 72 families in 11 orders. In the High Moor, Yongneup of Mt. Daeam, Kim and Jung(2007) reported 220 species, 62 families in 11 orders. Kim(2004) and Paek and Song(2007) reported 126 species, 60 families in 15 orders and 308 species, 102 families in 15 orders respectively in Jangdo Island High Moor. Cho and Kim(2002) reported 81 species, 43 families in 11 orders in Du-ung Wetland area and Lee and Oh(2006) reported 121 species, 18 families in 9 orders in Upo Wetland area. Additionally, Lee(1997) reported 60 species, 40 families in 8 orders, Do *et al.*(2002) reported 124 species, 60 families in 11 orders and Lee and Lee(2006) reported 34 species, 22 families in 10 orders terrestrial insects in Moojechineup area. In particular, in Muljangori Wetland, the High Moor, Yongneup of Mt. Daeam and Jangdo Island High Moor various insects were reported as 182 species, 220 species

and 308 species respectively.

Muljangori Wetland(63 ha) and the High Moor, Yongneup(106 ha) of Mt. Daeam have lower insect diversity per unit than Mulyeongari-Oreum Wetland because they are relatively wider than Mulyeongari-Oreum Wetland(31 ha). Jangdo Island High Moor(9 ha) showed high level of insect diversity per unit reporting more species than Mulyeongari-Oreum Wetland although it is no more than a third of Mulyeongari-Oreum Wetland in size. However, Jangdo Island High Moor survey result included 126 literature species and the survey area was wide because wide area around the wetland was included in the survey. It is judged that the 229 species which come from Mulyeongari-Oreum Wetland and its neighboring ecosystem in Mt. Sooryeong can compete with other wetlands considering the aforementioned reasons(Table 2).

Table 2. Insect diversity of registered Ramsar wetlands in South Korea

Wetlands (Area, ha)		Investigated results
Muljangori-Oreum Wetland (63)	Cho and Kim (1998a) 31 species, 20 families in 7 orders	Jung(2001) 182 species, 72 families in 11 orders
High Moor, Yongneup of Mt. Daeam (106)	Kim and Jung (2007) 220 species, 62 families in 11 orders	
Jangdo Island High Moor (9)	Kim (2004) 126 species, 60 families in 15 orders	Paek and Song (2007) 308 species, 102 families in 15 orders
Du-ung Wetland (6)	Cho and Kim (2002) 81 species, 43 families in 11 orders	
Upo Wetland (854)	Lee and Oh (2006) 121 species, 18 families in 9 orders	
Moojechineup (4)	Lee (1997) 60 species, 40 families in 8 orders	Do <i>et al.</i> (2002) 124 species, 60 families in 11 orders
Mulyeongari-Oreum Wetland (31)	Cho and Kim (1998a) 41 species, 22 families in 5 orders	Lee and Lee (2006) 34 species, 22 families in 10 orders
	Cha (1999) 26 species, 14 families in 5 orders	This study (2008) 136 species, 39 families in 6 orders

2. Taxonomic Composition

Looking at the appearance ratio by order, members of Lepidoptera and Coleoptera made up approximately two thirds of total species as 106 species(46%) and 45 species(20%), respectively. The next orders are Hymenoptera(11%) with 25 species, Hemiptera(8%) with 19 species, and Diptera(6%) with 13 species. By survey place, in Mulyeongari-Oreum Wetland the order of species was reported as Lepidoptera 77 species(57%), Coleoptera 31 species(23%), Hymenoptera 15 species(11%). In Mt. Sooryeong, the same order was reported as Lepidoptera 42 species(35%), Coleoptera 19 species(16%), Hymenoptera 17 species(14%)(Table 3).

It is thought that the reasons why members of Lepidoptera and Coleoptera were absolutely dominant in the survey are because they are large taxonomic groups and because the methods used to collect the insects, Light Trap and Pitfall Trap, favored collection of these kinds of insects. Cho and Kim(1998) and Cha(1999) used relatively simple collection methods such as air net and sweeping the water weed field for adult aquatic insects. As a result, in their surveys, not even a single species of Lepidoptera, Hymenoptera or Diptera was reported. Most

of the specimens they collected were members of Coleoptera(28 species, 60%), Hemiptera(8 Species, 17%), and Odonata(4 species, 8%).

3. Moth Community Analysis

For the moth community analysis of the Mulyeongari-Oreum Wetland, the highest species diversity index occurred in July(3.42) and the lowest in April(2.49). The dominant species was *Hydrillodes morosa*(Butler) with dominance index of 0.12(Table 4).

The species diversity index ranged from 2.49 to 3.42. This was relatively lower than general survey results. One reason many kinds of moths were not reported may have been because light from the light trap was obstructed by the trees with same height as Mulyeongari-Oreum Wetland is located in a deep crater. Additionally, on the interior slope, broad-leaved forest trees such as *Carpinus laxiflora* (Siebold & Zucc.) Blume, *Cornus kousa* F.Buerger ex Miquel, *Styrax japonicus* Siebold & Zucc. and *Neolitsea sericea*(Blume) Koidz. were dominant, while on the exterior slope, there was an artificial plantation of trees such as *Cryptomeria japonica*(L.f.) D.Don and *Pinus thunbergii* Parl.. Therefore, it is possible that the food plants of the

Table 3. Number of families and species within the orders collected in investigated areas

Order	Mulyeongari-Oreum Wetland		Mt. Sooryeong		Total	
	Families	Species	Families	Species	Families	Species
Odonata	0	0	2	6	2	6
Mantodea	0	0	1	2	1	2
Orthoptera	0	0	6	10	6	10
Hemiptera	3	11	7	9	8	19
Homoptera	1	1	3	3	3	3

Table 4. Seasonal community analysis of moths collected from Mulyeongari-Oreum Wetland

Season	Dominant Species	Dominance Index	Species Diversity Index
April	<i>Odontopera arida</i> (Butler)	0.21	2.49
July	<i>Hydrillodes morosa</i> (Butler)	0.19	3.42
October	<i>Neocifuna jankowskii</i> (Oberthür)	0.19	2.94
Total	<i>Hydrillodes morosa</i> (Butler)	0.12	

moths were restricted in that area. *Hydrillodes morosa*(Butler) was the dominant species not only in July but also in total, and appeared from May till August. It is a general species distributed all over Korea. *Odontopera arida*(Butler) is also a general species appearing from May to June and from August to September. On the other hand, *Neocifuna jankowskii*(Oberthür) appears once a year from July to September. Although they are species with not many individuals, they were dominant in the Autumn survey. The food plants for those three species are unknown(Kim *et al.*, 1983; Shin *et al.*, 1983; Shin, 2001).

4. Protected Species

No species registered on the IUCN Red List were collected in this area. However, 37 species of protected species were reported, including *Copris tripartitus* Waterhouse which falls under the Second Grade of endangered species of wildlife fauna and flora in Korea. In the Mulyeongari-Oreum Wetland, 12 species were reported such as 8 specific species, 3 approved species for delivering overseas and 1 endangered species. In Mt. Sooryeong, 25 species such as 5 endemic species, 19 specific species and 1 endangered species were reported. Cho and Kim(1998a) and Cha (1999) reported 7 and 5 protected species respectively including *Lethocerus deyrollei*(Vuillefroy) and *C. tripartitus* Waterhouse(Figure 2, Table 5).

In our survey, many more protected species were reported compared to previous surveys. However, the second grade endangered species, *L. deyrollei*(Vuillefroy) was not reported in this survey because our survey focused on terrestrial insects and did not make separate surveys of benthic macroinvertebrates and aquatic insects. The *C.*

tripartitus Waterhouse was first reported by Cha(1999) and confirmed in this survey in 2008. This means that the habitat has been preserved well for nearly ten years and that conditions favor *C. tripartitus* Waterhouse habitation as cow and horse dung is very abundant. Although *L. deyrollei*(Vuillefroy) has not been reported in this survey, in 2008, as well as 1998 to 1999, it was reported in two places near Dongbaekdongsan(Mt.) which is near Mulyeongari-Oreum Wetland. Considering that, it is highly probable that they still inhabit this area. As they are a protected species being endangered, continuous and precise monitoring should be performed. In the nighttime light trap survey, *Lychnuris rufa*(Olivier) was identified. Thus, it seems that two kinds of fireflies inhabit this area with *Luciola lateralis* Motshulsky which was identified by hearing from local residents.

Figure 2. *Copris tripartitus* Waterhouse, the Second Grade of Endangered Species in Korea, collected from Mulyeongari-Oreum Wetland and Mt. Sooryeong in 2008

Table 5. Legally protected species collected from Mulyeongari-Oreum Wetland and Mt. Sooryeong

<i>Lema (Lema) coronata</i> Baly	가시다리큰벼잎벌레							○	
<i>Altica caeruleascens</i> (Baly)	발리잎벌레					2			

Appendix 1. (Continued)

Scientific name	Korean name	April		July		October		Cho & Kim (1999a)	Cha (1999)
		MOW	MS	MOW	MS	MOW	MS		
<i>Batophila acutangula</i> Heikertinger	콩알벼룩잎벌레	17							
<i>Chaetocnema (Chaetocnema) ingenua</i> (Baly)	두줄털다리벼룩잎벌레	4							
<i>Sphaeroderma placidum</i> Harold						2			
Family Anthribidae	소바구미과								
<i>Tropideres naevulus</i> Faust	날개悱소바구미	1							
Order Hymenoptera	벌目								
Family Ichneumonidae	맵시벌科								
<i>Pimpla luctuosa</i> Smith							1		
<i>Ophioninae</i> sp.							4		
<i>Trogus bicolor</i> Radoszkowski	두색맵시벌						1		
<i>Alomyini</i> sp.							1		
Family Scoliidae	배벌科								
<i>Campsomeris (Megacampsemeris) prismatica</i> Smith	금테줄배벌						1		
Family Formicidae	개미科								
<i>Camponotus kiusuensis</i> Santsch	갈색발왕개미	+							
<i>Camponotus vitiosus</i> Kim et Kim	제주왕개미	+							
<i>Crematogaster matsumurai</i> Forel	마쓰무라밀들이개미	++							
<i>Crematogaster osakensis</i> Forel	노랑밀들이개미	+++	+++	+++	+++	+++	+++		
<i>Formica japonica</i> Motschulsky	곰개미	+++	+	+++	+	+++	+++		
<i>Lasius flavus</i> (Fabricius)	황개미								
<i>Lasius hayashi</i> Yamauchi et Hayashida	하야시털개미	++	++					+	
<i>Lasius japonicus</i> (Latreille)	고동털개미	++	+						
<i>Myrmecina nipponica</i> Wheeler	가시방패개미	+							
<i>Pachycondyla javana</i> Mayr	일본침개미	+							
<i>Paratrechina flavipes</i> (Smith)	스미스개미	++	++	++	++	++	++

<i>Camponotus (Camponotus) obscuripes</i> Mayr	홍가슴개미						+		
Family Pompilidae	대모벌科								
<i>Cyphononyx dorsalis</i> (Lepeletier)	대모벌					2			
Family Sphecidae	구멍벌科								
<i>Psen affinis</i> Gussakovskij	구사코브스키꼬마구멍벌						1		
Family Apidae	꿀벌科								
<i>Ceratina japonica</i> Cockerell	일본광채꽃벌						2		
<i>Apis mellifera</i> Linné	양봉꿀벌					2			
Order Diptera	파리目								
Family Stratiomyidae	동애동애科								
<i>Hermetia illucens</i> (Linnaeus)	아메리카동애동애						1		
Family Asilidae	파리매科								
<i>Promachus yesonicus</i> Bigot	파리매					1			
Family Dolichopodidae	장다리파리科								
<i>Mesorhaga nebula</i> (Matsumura)	얼룩장다리파리					1			
Family Syrphidae	꽃동에科								
<i>Episyrrhus balteatus</i> (de Geer)	호리꽃동에						1		
<i>Betasyrphus serarius</i> (Wiedemann)	검정넓적꽃동에					2			
<i>Sphaerophoria menthastris</i> (Linné)	꼬마꽃동에					3			
<i>Melanostoma mellinum</i> (Linné)	광붙이꽃동에					1			
<i>Paragus haemorrhois</i> Meigen	고려꽃동에						3		
<i>Helophilus (Helophilus) virgatus</i> Coquillett	수증다리꽃동에	1					1		
Family Platystomatidae	알락파리科								
<i>Rivellia alini</i> Enderlein	알린콩알락파리					5			
Family Muscidae	집파리科								
<i>Musca domestica</i> (Linné)	집파리						2		
Family Tachinidae	기생파리科								
<i>Tachina nupta</i> (Rondan)	등줄기생파리						1		
<i>Cylindromyia (Cylindromyia) brassicaria</i> (Fabricius)	표주박기생파리						1
