# TOEPLITZ AND HANKEL OPERATORS WITH CARLESON MEASURE SYMBOLS 

Jaehui Park

#### Abstract

In this paper, we introduce Toeplitz operators and Hankel operators with complex Borel measures on the closed unit disk. When a positive measure $\mu$ on $(-1,1)$ is a Carleson measure, it is known that the corresponding Hankel matrix is bounded and vice versa. We show that for a positive measure $\mu$ on $\mathbb{D}, \mu$ is a Carleson measure if and only if the Toeplitz operator with symbol $\mu$ is a densely defined bounded linear operator. We also study Hankel operators of Hilbert-Schmidt class.

## 1. Introduction

Let $\mathbb{D}$ and $\mathbb{T}$ denote the open unit disk and the unit circle in the complex plane, respectively. A Toeplitz operator with bounded symbol is a compression to $H^{2}$ of a multiplication operator on $L^{2}(\mathbb{T})$. Toeplitz operators were introduced by O. Toeplitz [22,23] and interesting properties of them have been studied by many authors (cf. [2, 3, 14, 20, 24], etc.). In addition, Toeplitz operators have been studied in various function spaces other than $H^{2}$ (cf. [1, 10, 19, 21]). Research on Toeplitz operators with operator-valued symbols can be found in the papers [6-9]. The author [17] has investigated Toeplitz operators with symbols of complex Borel measures on $\mathbb{T}$. In this paper, we define Toeplitz operators and Hankel operators on $H^{2}$ whose symbols are complex Borel measures on the closed unit disk $\overline{\mathbb{D}}=\mathbb{D} \cup \mathbb{T}$.

The Hardy space $H^{2}$ is the class of analytic functions on $\mathbb{D}$ whose Taylor coefficients are square summable. The $H^{2}$-functions also can be viewed as square integrable functions on $\mathbb{T}$ via nontangential limit. We refer the reader to the texts [11], [15], and [16] for details of Hardy spaces. Throughout this paper we use $\|\cdot\|_{2}$ and $\langle\cdot, \cdot\rangle$ to denote the norm and the inner product in $H^{2}$, respectively.

[^0]Let $M(\overline{\mathbb{D}})$ denote the space of complex Borel measures on $\overline{\mathbb{D}}$. For $\mu \in M(\overline{\mathbb{D}})$ and for $n, k \in \mathbb{N}_{0}$, define the $(n, k)$-moment of $\mu$ by

$$
\mu_{n, k}=\int_{\overline{\mathbb{D}}} z^{n} \bar{z}^{k} d \mu(z)
$$

If $k=0$, we simply write $\mu_{n}=\mu_{n, 0}$. Observe that

$$
\left|\mu_{n, k}\right| \leq \int_{\overline{\mathbb{D}}}|z|^{n+k} d|\mu|(z) \leq\|\mu\|
$$

Hence the double sequence $\left\{\mu_{n, k}\right\}$ is bounded. Note that every complex Borel measure on $\overline{\mathbb{D}}$ is completely determined by its moments. To see this, suppose that $\mu$ and $\nu$ are complex Borel measures on $\overline{\mathbb{D}}$ such that $\mu_{n, k}=\nu_{n, k}$ for every $n, k \in \mathbb{N}_{0}$. Then

$$
\begin{equation*}
\int_{\overline{\mathbb{D}}} f d \mu=\int_{\mathbb{D}} f d \nu \tag{1}
\end{equation*}
$$

whenever $f=p(z, \bar{z})$ is a trigonometric polynomial. Since the trigonometric polynomials are dense in $C(\overline{\mathbb{D}})$ with respect to the supremum norm, the identity (1) holds for every $f \in C(\overline{\mathbb{D}})$. In view of the Riesz representation theorem, this shows that the measure $\mu-\nu$ is a linear functional on $C(\overline{\mathbb{D}})$ which is zero. It follows that $\mu-\nu=0$, i.e., $\mu=\nu$.

Let $m_{2}$ be the normalized Lebesgue measure on $\overline{\mathbb{D}}$ so that $m_{2}(\overline{\mathbb{D}})=1$. Then, for every $n, k \in \mathbb{N}_{0}$,

$$
\left(m_{2}\right)_{n, k}=\int_{\mathbb{D}} z^{n} \bar{z}^{k} d m_{2}(z)=\frac{1}{\pi} \int_{0}^{1} \int_{0}^{2 \pi} r^{n+k+1} e^{i(n-k)} d \theta d r
$$

Thus $\left(m_{2}\right)_{n, k}=\frac{1}{n+1}$ if $n=k$, and $\left(m_{2}\right)_{n, k}=0$ otherwise. On the other hand, the moments of the unit mass $\delta_{0}$ concentrated at the point $z=0$ is

$$
\left(\delta_{0}\right)_{n, k}= \begin{cases}1 & (n=k=0) \\ 0 & (\text { otherwise })\end{cases}
$$

Let $C_{A}(\mathbb{D})$ be the disk algebra, i.e., the set of all continuous functions on $\overline{\mathbb{D}}$ which are analytic in $\mathbb{D}$. For $f \in C_{A}(\mathbb{D})$, define a function $\mathcal{T}_{\mu} f$ on $\mathbb{D}$ by

$$
\begin{equation*}
\left(\mathcal{T}_{\mu} f\right)(z):=\int_{\overline{\mathbb{D}}} \frac{f(w)}{1-\bar{w} z} d \mu(w) \quad(z \in \mathbb{D}) \tag{2}
\end{equation*}
$$

Note that, for each $z \in \mathbb{D}$, the series $\frac{1}{1-\bar{w} z}=\sum_{n=0}^{\infty} \bar{w}^{n} z^{n}$ converges uniformly on $\overline{\mathbb{D}}$. It follows that

$$
\begin{align*}
\mathcal{T}_{\mu} f(z) & =\int_{\overline{\mathbb{D}}} f(w) \sum_{n=0}^{\infty} \bar{w}^{n} z^{n} d \mu(w) \\
& =\sum_{n=0}^{\infty} \int_{\overline{\mathbb{D}}} f(w) \bar{w}^{n} d \mu(w) z^{n}=\sum_{n=0}^{\infty}(f \cdot \mu)_{0, n} z^{n} . \tag{3}
\end{align*}
$$

Therefore the function $\mathcal{T}_{\mu} f$ is analytic in $\mathbb{D}$. If $\mathcal{T}_{\mu} f$ belongs to the Hardy space $H^{2}$, we say that $f \in \mathcal{D}\left(\mathcal{T}_{\mu}\right)$. That is, we define

$$
\mathcal{D}\left(\mathcal{T}_{\mu}\right)=\left\{f \in C_{A}(\mathbb{D}): \mathcal{T}_{\mu} f \in H^{2}\right\}
$$

It is easy to see that $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$ is a linear subspace of $H^{2}$. The mapping $\mathcal{T}_{\mu}$ is a linear operator $H^{2}$ with domain $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$.

Similarly, we define a linear operator $\mathcal{H}_{\mu}$ on $H^{2}$ with domain

$$
\mathcal{D}\left(\mathcal{H}_{\mu}\right)=\left\{f \in C_{A}(\mathbb{D}): \mathcal{H}_{\mu} f \in H^{2}\right\}
$$

where

$$
\begin{equation*}
\left(\mathcal{H}_{\mu} f\right)(z):=\int_{\overline{\mathbb{D}}} \frac{f(w)}{1-w z} d \mu(w) \quad(z \in \mathbb{D}) \tag{4}
\end{equation*}
$$

Definition. The linear operator $\mathcal{T}_{\mu}$ is called the Toeplitz operator with symbol $\mu$. The linear operator $\mathcal{H}_{\mu}$ is called the Hankel operator with symbol $\mu$.

If $\varphi \in L^{\infty}$, the classical Toeplitz operator $T_{\varphi}$ on $H^{2}$ is given by

$$
\left(T_{\varphi} f\right)(z)=P(\varphi f)(z)=\int_{\mathbb{T}} \frac{f(\zeta)}{1-\bar{\zeta} z} \varphi(\zeta) d m(\zeta) \quad\left(f \in H^{2}\right)
$$

where $P$ is the orthogonal projection of $L^{2}$ onto $H^{2}$ and $m$ is the normalized Lebesgue measure on $\mathbb{T}$. The identity (2) is a generalization of the above identity. Similarly, the identity (4) is a generalization of the identity for the Hankel operator $H_{\varphi}$ :

$$
\left(H_{\varphi} f\right)(z)=\int_{\mathbb{T}} \frac{\zeta f(\zeta)}{1-\zeta z} \varphi(\zeta) d m(\zeta) \quad\left(f \in H^{2}\right)
$$

(For notational convenience, we divided the integrand in (4) by the variable w.) Note also that if $\operatorname{supp} \mu \subseteq[-1,1]$, then $\mathcal{T}_{\mu}=\mathcal{H}_{\mu}$.

Properties of the operator $\mathcal{T}_{\mu}$ when $\operatorname{supp} \mu \subseteq \mathbb{T}$ have been studied in the paper [17]. Some of them also hold for $\mathcal{T}_{\mu}$ and $\mathcal{H}_{\mu}$. For example, for the domain $\mathcal{D}=\mathcal{D}\left(\mathcal{T}_{\mu}\right), \mathcal{D}\left(\mathcal{H}_{\mu}\right)$, one of the following holds:
(i) $\mathcal{D}=\{0\}$.
(ii) $\mathcal{D}$ is dense in $H^{2}$.
(iii) $\mathrm{cl}_{H^{2}} \mathcal{D}=\theta H^{2}$, where $\theta$ is a singular inner function.

In this paper we focus on the boundedness of Toeplitz operators $\mathcal{T}_{\mu}$ and the Hilbert-Schmidt class of the Hankel operators $\mathcal{H}_{\mu}$. In Section 2, we will show that $\mathcal{T}_{\mu}$ is densely defined bounded linear operator if and only if $\mu$ is a Carleson measure. In Section 3, we provide a general sufficient condition for Hankel operators to belong to the Hilbert-Schmidt class.

## 2. The boundedness of $\mathcal{T}_{\mu}$

Let $T(\mu)$ be the infinite matrix whose entries are the moments of $\mu \in M(\overline{\mathbb{D}})$ :

$$
T(\mu):=\left[\begin{array}{cccc}
\mu_{0,0} & \mu_{1,0} & \mu_{2,0} & \cdots  \tag{5}\\
\mu_{0,1} & \mu_{1,1} & \mu_{2,1} & \cdots \\
\mu_{0,2} & \mu_{1,2} & \mu_{2,2} & \cdots \\
\vdots & \vdots & \vdots & \ddots
\end{array}\right]
$$

The moment matrix $T(\mu)$ corresponds to $\mathcal{T}_{\mu}$ in some sense by (3). If the support of $\mu$ is contained in $\mathbb{T}$, then

$$
\mu_{n, k}=\int_{\mathbb{T}} z^{n} \bar{z}^{k} d \mu(z)=\int_{\mathbb{T}} z^{n-k} d \mu(z)
$$

for every $n, k \in \mathbb{N}_{0}$. Hence the matrix $T(\mu)$ is a Toeplitz matrix. On the other hand, if the support of $\mu$ is contained in the segment $(-1,1)$, then

$$
\mu_{n, k}=\int_{(-1,1)} x^{n} x^{k} d \mu(x)=\int_{(-1,1)} x^{n+k} d \mu(x)
$$

for every $n, k \in \mathbb{N}_{0}$. Hence the matrix $T(\mu)$ is a Hankel matrix.
Another matrix we consider is the infinite Hankel matrix

$$
H(\mu):=\left[\begin{array}{cccc}
\mu_{0} & \mu_{1} & \mu_{2} & \cdots  \tag{6}\\
\mu_{1} & \mu_{2} & \mu_{3} & \cdots \\
\mu_{2} & \mu_{3} & \mu_{4} & \cdots \\
\vdots & \vdots & \vdots & \ddots
\end{array}\right],
$$

which corresponds to $\mathcal{H}_{\mu}$. Recall that $\mu_{n}=\mu_{n, 0}$.
A linear operator $\mathcal{T}_{\mu}$ may not be bounded.
Example 2.1. (a) Suppose that $\alpha \in \mathbb{D}$. Let $\mu=\delta_{\alpha}$ be the unit mass concentrated at the point $\alpha \in \mathbb{D}$. If $f \in C_{A}(\mathbb{D})$, then

$$
\mathcal{T}_{\mu} f(z)=\int_{\mathbb{D}} \frac{f(w)}{1-\bar{w} z} d \mu(w)=\frac{f(\alpha)}{1-\bar{\alpha} z} \quad(z \in \mathbb{D})
$$

Note that the function $k_{\alpha}(z)=\frac{1}{1-\bar{\alpha} z}$ is the reproducing kernel function for $H^{2}$. Then

$$
\mathcal{T}_{\mu} f=\left\langle f, k_{\alpha}\right\rangle k_{\alpha}=\left(k_{\alpha} \otimes k_{\alpha}\right) f .
$$

In particular, $\mathcal{T}_{\mu} f \in H^{2}$. Therefore $\mathcal{D}\left(\mathcal{T}_{\mu}\right)=C_{A}(\mathbb{D})$ and $\mathcal{T}_{\mu}$ is a restriction of the rank one projection $k_{\alpha} \otimes k_{\alpha}$ to $C_{A}(\mathbb{D})$. The matrix representation of $\mathcal{T}_{\mu}$ is

$$
T(\mu)=\left[\begin{array}{cccc}
1 & \alpha & \alpha^{2} & \ldots \\
\bar{\alpha} & \bar{\alpha} \alpha & \bar{\alpha} \alpha^{2} & \ldots \\
\bar{\alpha}^{2} & \bar{\alpha}^{2} \alpha & \bar{\alpha}^{2} \alpha^{2} & \ldots \\
\vdots & \vdots & \vdots & \ddots
\end{array}\right] .
$$

TOEPLITZ AND HANKEL OPERATORS WITH CARLESON MEASURE SYMBOLS 95
(b) Consider the function

$$
\varphi(x)=\frac{1}{2 \sqrt{1-x}} \quad(0 \leq x<1)
$$

Let $m_{1}$ denote the Lebesgue measure on $[0,1)$. Since

$$
\int_{[0,1)}|\varphi| d m_{1}=\int_{0}^{1} \frac{1}{2 \sqrt{1-x}} d x=\int_{0}^{1} \frac{1}{2 \sqrt{y}} d y=1
$$

the function $\varphi$ belongs to $L^{1}\left(m_{1}\right)$. Hence $\mu:=\varphi \cdot m_{1}$ is a finite positive Borel measure on $\mathbb{D}$. For each $n \in \mathbb{N}_{0}$,

$$
\mu_{n}=\int_{0}^{1} \frac{x^{n}}{2 \sqrt{1-x}} d x=\int_{0}^{1} \frac{(1-y)^{n}}{2 \sqrt{y}} d y=\int_{0}^{1}\left(1-x^{2}\right)^{n} d x
$$

If $n \geq 1$, by integration by parts,

$$
\begin{aligned}
\mu_{n} & =2 n \int_{0}^{1} x^{2}\left(1-x^{2}\right)^{n-1} d x \\
& =2 n \int_{0}^{1}\left(1-\left(1-x^{2}\right)\right)\left(1-x^{2}\right)^{n-1} d x=2 n\left(\mu_{n-1}-\mu_{n}\right)
\end{aligned}
$$

Hence we have

$$
\mu_{0}=1, \quad \mu_{n}=\frac{2 n}{2 n+1} \mu_{n-1} \quad(n=1,2,3, \ldots)
$$

By using the induction, we can show that

$$
\frac{1}{2 n+1} \leq \mu_{n}^{2} \leq \frac{1}{n+1}
$$

for every $n \in \mathbb{N}_{0}$. Hence $\left\{\mu_{n}\right\} \notin \ell^{2}$. Note that the domain $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$ does not contain all polynomials. Indeed, if $f_{n}(z)=z^{n}$, then

$$
\mathcal{T}_{\mu} f_{n}(z)=\int_{0}^{1} \frac{\varphi(x) x^{n}}{1-x z} d \mu(x)=\sum_{k=0}^{\infty} \mu_{n+k} z^{k}
$$

which does not belong to $H^{2}$ because $\left\{\mu_{n+k}\right\}_{k \geq 0} \notin \ell^{2}$. Hence $z^{n} \notin \mathcal{D}\left(\mathcal{T}_{\mu}\right)$ for any $n \in \mathbb{N}_{0}$. On the other hand, if $p_{n}(z)=1-z^{n}$, then

$$
\mathcal{T}_{\mu} p_{n}(z)=\sum_{k=0}^{\infty}\left(\mu_{k}-\mu_{n+k}\right) z^{k}
$$

Since $\mu_{k}-\mu_{n+k} \leq \frac{\mu_{k}}{2 k}$, the sequence $\left\{\mu_{k}-\mu_{n+k}\right\}_{k \geq 0}$ belongs to $\ell^{2}$. Hence $\mathcal{T}_{\mu} p_{n} \in H^{2}$, i.e., $p_{n} \in \mathcal{D}\left(\mathcal{T}_{\mu}\right)$. Observe that $\left\|p_{n}\right\|_{2}^{2}=2$, but

$$
\left\|\mathcal{T}_{\mu} p_{n}\right\|_{2}^{2}=\sum_{k=0}^{\infty}\left|\mu_{k}-\mu_{n+k}\right|^{2} \rightarrow \infty
$$

as $n \rightarrow \infty$. This shows that $\mathcal{T}_{\mu}$ is unbounded.

If $\mu$ is a complex Borel measure on $\overline{\mathbb{D}}$, we may write $\mu=\mu_{1}+\mu_{2}$, where $\mu_{1}$ and $\mu_{2}$ are complex Borel measures on $\overline{\mathbb{D}}$ which are concentrated on $\mathbb{T}$ and $\mathbb{D}$, respectively. Then $\mathcal{T}_{\mu} f=\mathcal{T}_{\mu_{1}} f+\mathcal{T}_{\mu_{2}} f$ for $f \in C_{A}(\mathbb{D})$. In the case of $\operatorname{supp} \mu \subseteq \mathbb{T}$, the following is known (see e.g., [26]):

Theorem 2.2. Let $\mu \in M(\mathbb{T})$. The followings are equivalent:
(a) $\mu$ is a compatible measure, i.e., $\int_{\mathbb{T}}|f|^{2} d \mu \leq c \int_{\mathbb{T}}|f|^{2} d m$ for all $f \in$ $C_{A}(\mathbb{D})$.
(b) $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$ contains all polynomials and $\mathcal{T}_{\mu}$ is bounded on $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$.

In the remainder of this paper we will focus on the case of measures concentrated in $\mathbb{D}$ and investigate the boundedness of $\mathcal{T}_{\mu}$. A compatible measure is replaced by a positive Carleson measure. A complex Borel measure $\mu$ on $\mathbb{D}$ is called a Carleson measure if there exists a constant $c>0$ such that

$$
|\mu|\left(S_{\theta_{0}, h}\right) \leq c \cdot h
$$

for every sector $S_{\theta_{0}, h}=\left\{r e^{i \theta}: 1-h \leq r<1,\left|\theta_{0}-\theta\right| \leq h\right\}$. The Carleson imbedding theorem (cf. [4], [13]) shows that a complex Borel measure $\mu$ on $\mathbb{D}$ is a Carleson measure if and only if there exists a constant $c>0$ such that

$$
\int_{\mathbb{D}}|f|^{2} d|\mu| \leq c \cdot\|f\|_{2}^{2}
$$

for every $f \in H^{2}$, or equivalently, the identical imbedding operator $I_{\mu}$ from $H^{2}$ into $L^{2}(\mathbb{D},|\mu|)$, given by

$$
I_{\mu} f=f \quad\left(f \in H^{2}\right)
$$

is bounded. If

$$
\lim _{h \rightarrow 0} \frac{|\mu|\left(S_{\theta_{0}, h}\right)}{h}=0
$$

the measure $\mu$ is called a vanishing Carleson measure. In this case $I_{\mu}$ becomes a compact operator.

An interesting relation between Hankel matrices and Carleson measures was studies by [25] (see also [18]): An infinite Hankel matrix $\left\{\alpha_{j+k}\right\}_{j, k \geq 0}$ determines a bounded operator on $\ell^{2}$ if and only if there exists a Carleson measure $\mu$ on $\mathbb{D}$ such that $\alpha_{j}=\int_{\mathbb{D}} w^{j} d \mu(w)$ for all $j \geq 0$. As a result, for a measure $\mu$ on the segment $(-1,1)$, the moment matrix $T(\mu)$ is bounded if and only if $\mu$ is a Carleson measure. In particular, we can see that $\mathcal{T}_{\mu}$ is bounded.

We extend this result to the case when $\mu$ is a positive measures on $\mathbb{D}$. To do this, we first observe the following lemma.

Lemma 2.3. Let $\mu \in M(\overline{\mathbb{D}})$. Then

$$
\left\langle\mathcal{T}_{\mu} f, g\right\rangle=\int_{\overline{\mathbb{D}}} f \bar{g} d \mu
$$

for every $f \in \mathcal{D}\left(\mathcal{T}_{\mu}\right)$ and $g \in C_{A}(\mathbb{D})$.

Proof. The proof of the lemma for measures on $\mathbb{T}$ can be found in [17]. The proof of the lemma for measures on $\overline{\mathbb{D}}$ is exactly same. For the sake of completeness, we give the proof.

Suppose that $f \in \mathcal{D}\left(\mathcal{T}_{\mu}\right)$ and $g \in C_{A}(\mathbb{D})$, so that $\mathcal{T}_{\mu} f \in H^{2}$. Write $\mathcal{T}_{\mu} f=$ $\sum_{n=0}^{\infty} a_{n} z^{n}$ and $g=\sum_{n=0}^{\infty} b_{n} z^{n}$. Then

$$
\left\langle\mathcal{T}_{\mu} f, g\right\rangle=\sum_{n=0}^{\infty} a_{n} \overline{b_{n}}
$$

By (3), for each $z \in \mathbb{D}$,

$$
\left(\mathcal{T}_{\mu} f\right)(z)=\sum_{n=0}^{\infty}\left[\int_{\overline{\mathbb{D}}} f(w) \bar{w}^{n} d \mu(w)\right] z^{n} .
$$

Hence we have

$$
a_{n}=\int_{\overline{\mathbb{D}}} f(w) \bar{w}^{n} d \mu(w) \quad(n=0,1,2, \ldots) .
$$

Observe that, for each $0<r<1$,

$$
g_{r}=\sum_{n=0}^{\infty} b_{n} r^{n} z^{n} \in C_{A}(\mathbb{D})
$$

It follows that

$$
\begin{aligned}
\left\langle\mathcal{T}_{\mu} f, g_{r}\right\rangle=\sum_{n=0}^{\infty} a_{n} \overline{b_{n}} r^{n} & =\sum_{n=0}^{\infty} \int_{\overline{\mathbb{D}}} f(w) \bar{w}^{n} \overline{b_{n}} r^{n} d \mu(w) \\
& =\int_{\overline{\mathbb{D}}} f(w) \overline{\sum_{n=0}^{\infty} b_{n} r^{n} w^{n}} d \mu(w)=\int_{\overline{\mathbb{D}}} f(w) \overline{g_{r}(w)} d \mu(w)
\end{aligned}
$$

If we let $r \rightarrow 1$, then $\left\|g-g_{r}\right\|_{\infty} \rightarrow 0$, and hence $\left\langle\mathcal{T}_{\mu}, g_{r}\right\rangle \rightarrow\left\langle\mathcal{T}_{\mu}, g\right\rangle$ and $\int_{\overline{\mathbb{D}}} f \overline{g_{r}} d \mu \rightarrow \int_{\overline{\mathbb{D}}} f \bar{g} d \mu$. This completes the proof of the lemma.

Now we have:
Theorem 2.4. Let $\mu$ be a positive finite Borel measure on $\mathbb{D}$. Then the following statements are equivalent:
(a) $\mu$ is a Carleson measure.
(b) $\mathcal{T}_{\mu}$ is densely defined and bounded on its domain.

Proof. (a) $\Rightarrow(\mathrm{b})$. Suppose that $\mu$ is a Carleson measure. Then there exists a constant $c>0$ such that

$$
\int_{\mathbb{D}}|f g| d \mu \leq c\|f\|_{2}\|g\|_{2}
$$

for every $f, g \in C_{A}(\mathbb{D})$. Let $n \in \mathbb{N}_{0}$ and let $f(z)=z^{n}$. Then

$$
\mathcal{T}_{\mu} f(z)=\int_{\mathbb{D}} \frac{w^{n}}{1-\bar{w} z} d \mu(w)=\sum_{j=0}^{\infty} \int_{\mathbb{D}} w^{n} \bar{w}^{j} d \mu(w) z^{j}=\sum_{j=0}^{\infty} \mu_{n, j} z^{j}
$$

For each $k \in \mathbb{N}_{0}$, put $p_{k}(z)=\sum_{j=0}^{k} \mu_{n, j} z^{j}$. Then

$$
\int_{\mathbb{D}} f \overline{p_{k}} d \mu=\int_{\mathbb{D}} z^{n} \sum_{j=0}^{k} \overline{\mu_{n, j}} \bar{z}^{j} d \mu(z)=\sum_{j=0}^{k} \overline{\mu_{n, j}} \mu_{n, j}=\sum_{j=0}^{k}\left|\mu_{n, j}\right|^{2}=\left\|p_{k}\right\|_{2}^{2}
$$

Since $\left|\int_{\mathbb{D}} f \overline{p_{k}} d \mu\right| \leq c\|f\|_{2}\left\|p_{k}\right\|_{2}$, it follows that $\left\|p_{k}\right\|_{2} \leq c\|f\|_{2}$. Hence

$$
\left\|\mathcal{T}_{\mu} f\right\|_{2}^{2}=\sum_{j=0}^{\infty}\left|\mu_{n, j}\right|^{2}=\lim _{k \rightarrow \infty}\left\|p_{k}\right\|_{2}^{2} \leq c\|f\|_{2}<\infty
$$

Therefore, $\mathcal{T}_{\mu} f \in H^{2}$, i.e., $f \in \mathcal{D}\left(\mathcal{T}_{\mu}\right)$. We have shown that $\mathcal{D}\left(T_{\mu}\right)$ contains every monomial $z^{n}$. Since $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$ is a linear space, it contains all polynomials. Hence $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$ is dense in $H^{2}$ and $\mathcal{T}_{\mu}$ is bounded on $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$.
(b) $\Rightarrow$ (a). Suppose that $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$ is dense in $H^{2}$ and $\mathcal{T}_{\mu}$ is bounded on $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$. By Lemma 2.3, for every $f \in \mathcal{D}\left(\mathcal{T}_{\mu}\right)$,

$$
\int_{\mathbb{D}}|f|^{2} d \mu=\left|\left\langle\mathcal{T}_{\mu} f, f\right\rangle\right| \leq\left\|\mathcal{T}_{\mu}\right\|\|f\|_{2}^{2}
$$

Define $I_{\mu}: \mathcal{D}\left(\mathcal{T}_{\mu}\right) \rightarrow L^{2}(\mathbb{D}, \mu)$ by $I_{\mu} f=f$ for $f \in \mathcal{D}\left(\mathcal{T}_{\mu}\right)$. By the above inequality, we may extend $I_{\mu}$ to a bounded operator on $H^{2}$ with bound $\left\|\mathcal{T}_{\mu}\right\|^{1 / 2}$. Then, for every $f \in H^{2}$, we have

$$
\int_{\mathbb{D}}\left|I_{\mu} f\right|^{2} d \mu \leq\left\|\mathcal{T}_{\mu}\right\|\|f\|_{2}^{2}
$$

Now let $f \in H^{2}$ and let $\left\{f_{n}\right\}$ be a sequence in $\mathcal{D}\left(\mathcal{T}_{\mu}\right)$ which converges to $f$. Then $f_{n}(z) \rightarrow f(z)$ for every $z \in \mathbb{D}$. On the other hand, since $I_{\mu}$ is bounded, we have $I_{\mu} f_{n}\left(=f_{n}\right) \rightarrow I_{\mu} f$ in $L^{2}(\mathbb{D}, \mu)$. It follows from Fatou's lemma that

$$
\begin{aligned}
\int_{\mathbb{D}}\left|I_{\mu} f-f\right|^{2} d \mu & \leq \liminf _{n \rightarrow \infty} \int_{\mathbb{D}}\left|I_{\mu} f-f_{n}\right|^{2} d \mu \\
& =\liminf _{n \rightarrow \infty}\left\|I_{\mu} f-f_{n}\right\|_{L^{2}(\mathbb{D}, \mu)}^{2}=0 .
\end{aligned}
$$

Thus $I_{\mu} f=f$ a.e. $[\mu]$. Hence we have $\int_{\mathbb{D}}|f|^{2} d \mu \leq\left\|\mathcal{T}_{\mu}\right\|\|f\|_{2}^{2}$ for every $f \in H^{2}$, i.e., $\mu$ is a Carleson measure.

Remark 2.5. A similar argument shows that $\mathcal{H}_{\mu}$ is densely defined and bounded on its domain whenever $\mu$ is a Carleson measure. For the converse, however, even in the case of $\mathcal{D}\left(\mathcal{H}_{\mu}\right)=C_{A}(\mathbb{D})$, we can only guarantee that there exists a Carleson measure $\nu$ such that $\mu_{n}=\nu_{n}$ for $n \in \mathbb{N}$.

## 3. The Hilbert-Schmidt class of $\mathcal{H}_{\mu}$

For $1 \leq p \leq \infty$, let $S_{p}$ denote the Schatten $p$-class of operators on $H^{2}$ (or $\ell^{2}$ ). If $p=1$, the following is known [18]: For $\mu \in M(\mathbb{D}), H(\mu) \in S_{1}$ if and only if $H(\mu)=H(\nu)$ for some finite complex measure $\nu$ such that

$$
\begin{equation*}
\int_{\mathbb{D}} \frac{1}{1-|w|^{2}} d \mu(w)<\infty \tag{7}
\end{equation*}
$$

In particular, if $\mu$ is a measure on $(-1,1)$ and $H(\mu) \in S_{1}$, then $\mu$ satisfies

$$
\int_{(-1,1)} \frac{1}{1-t^{2}} d \mu(t)<\infty
$$

Note that if $\mu$ is a complex measure on $\mathbb{D}$ satisfying (7), then $\mu$ is a vanishing Carleson measure.

Question 3.1. Under what conditions on $\mu$ does $H(\mu)$ belong to the HilbertSchmidt class $S_{2}$ (or $S_{p}$ )?

If $\mu$ is a positive Borel measure on $[0,1$ ), answers to the question are given by [5] and [12]:

Theorem 3.2 ([5]). Assume $1<p<\infty$ and let $\mu$ be a positive Borel measure on $[0,1)$. Then, $H(\mu) \in S_{p}$ if and only if $\sum_{n=0}^{\infty}(n+1)^{p-1} \hat{\mu}(n)^{p}<\infty$.

Theorem 3.3 ([12]). Let $\mu$ be a finite positive Borel measure on $[0,1)$ and suppose that $H(\mu)$ is bounded on $H^{2}$. Then $H(\mu) \in S_{2}$ if and only if

$$
\int_{[0,1)} \frac{\mu([t, 1))}{(1-t)^{2}} d \mu(t)<\infty
$$

By using this, we can find measures $\mu$ such that $\mathcal{H}_{\mu} \in S_{2} \backslash S_{1}$ or $\mathcal{H}_{\mu} \in S_{\infty} \backslash S_{2}$, e.g., $\mu:=\sum_{n \geq 1} c_{n} \delta_{\lambda_{n}}$, where $c_{n}=2^{-n}, \lambda_{n}=1-n \cdot 2^{-n}$.

Remark 3.4. (a) Theorem 3.2 also holds for a positive Borel measure on $(-1,1)$. To see this, define $\mu^{\prime}(E):=\mu(-E)$ for $E \subseteq(-1,1)$. Then $\mu_{n}^{\prime}=(-1)^{n} \mu_{n}$. Define $\tilde{\mu}:=\mu_{[0,1)}+\mu_{(0,1)}^{\prime}$. (Here, if $\mu_{[0,1)}$ is the measure on $[0,1)$ given by $\mu_{[0,1)}(E)=\mu(E \cap[0,1)$.$) Then (i) \tilde{\mu}$ is a measure supported on $[0,1)$; (ii) $\tilde{\mu}_{n}=\mu_{n}=\left|\mu_{n}\right|$, if $n$ is even; and (iii) $\tilde{\mu}_{n}=\int_{(-1,1)}\left|t^{n}\right| d \mu \geq\left|\mu_{n}\right|$, if $n$ is odd.

If $H(\mu) \in S_{p}$, then it is easy to show that $H(\tilde{\mu}) \in S_{p}$. Hence, by Theorem 3.2, $\sum_{n=0}^{\infty}(n+1)^{p-1}\left|\mu_{n}\right|^{p}<\infty$. Conversely, suppose that $\sum_{n=0}^{\infty}(n+$ $1)^{p-1}\left|\mu_{n}\right|^{p}<\infty$. Put

$$
a_{n}:=\int_{[0,1)} t^{n} d \mu_{[0,1)} \quad \text { and } \quad b_{n}:=\int_{(0,1)} t^{n} d \mu_{(0,1)}^{\prime}
$$

Then $a_{n}+b_{n}=\mu_{n}$ whenever $n$ is even, so

$$
\sum_{n: \text { even }}(n+1)^{p-1} a_{n}^{p}<\infty \quad \text { and } \quad \sum_{n: \text { even }}(n+1)^{p-1} b_{n}^{p}<\infty
$$

Since $\left\{a_{n}\right\}$ is a decreasing sequence of nonnegative numbers, it follows that $\sum_{n}(n+1)^{p-1} a_{n}^{p}<\infty$. By Theorem 3.2, we have $H\left(\mu_{[0,1)}\right) \in S_{p}$. In the same way, $H\left(\mu_{(0,1)}^{\prime}\right) \in S_{p}$. Observe that $b_{n}=(-1)^{n} \int_{(-1,0)} t^{n} d \mu$. Thus $H\left(\mu_{(-1,0)}\right)=$ $U \mathcal{H}_{\mu_{(0,1)}^{\prime}} U \in S_{p}$, where $U$ is the unitary map which maps $e_{n}$ to $(-1)^{n} e_{n}$. Therefore $\mathcal{H}_{\mu}=\mathcal{H}_{\mu_{[0,1)}}+\mathcal{H}_{\mu_{(-1,0)}} \in S_{p}$.
(b) By Theorem 3.2, we obtain

$$
H(\mu) \in S_{3} \Longleftrightarrow \sum_{n=0}^{\infty}(n+1)^{2} \hat{\mu}(n)^{3}<\infty
$$

Observe that

$$
\begin{aligned}
\sum_{n=0}^{\infty}(n+1)^{2} \hat{\mu}(n)^{3} & \approx \sum_{n=0}^{\infty} \frac{(n+1)(n+2)}{2} \hat{\mu}(n)^{3}=\sum_{i, j, k} \hat{\mu}(i+j+k)^{3} \\
\sum_{i, j, k} \hat{\mu}(i+j+k)^{3} & =\int_{[0,1)} \int_{[0,1)} \int_{[0,1)} \frac{1}{(1-t s u)^{3}} d \mu(u) \mu(s) \mu(t) \\
& \approx \int_{[0,1)} \frac{\mu([t, 1))^{2}}{(1-t)^{3}} d \mu(t)
\end{aligned}
$$

Therefore

$$
H(\mu) \in S_{3} \Longleftrightarrow \int_{[0,1)} \frac{\mu([t, 1))^{2}}{(1-t)^{3}} d \mu(t)<\infty
$$

In a similar manner, it may be true that, for $p=1,2,3, \ldots$,

$$
H(\mu) \in S_{p} \Longleftrightarrow \int_{[0,1)} \frac{\mu([t, 1))^{p-1}}{(1-t)^{p}} d \mu(t)<\infty
$$

Now we try to extend Theorem 3.3 to a measure on $\mathbb{D}$. Since $S_{1} \subseteq S_{2}$, the condition on $\mu$ must be weaker than (7). For $0<t<1$, define

$$
\mathbb{D}_{t}=\{z:|z|<t\}, \quad \mathbb{T}_{t}=\{z:|z|=t\}, \quad A_{t}=\{z: t<|z|<1\}
$$

Note that $\overline{\mathbb{D}_{t}}=\mathbb{D}_{t} \cup \mathbb{T}_{t}, \overline{A_{t}}=A_{t} \cup \mathbb{T}_{t}$, and $\mathbb{D}=\mathbb{D}_{t} \cup A_{t} \cup \mathbb{T}_{t}$. We first consider the positive measure on $\mathbb{D}$ such that

$$
\begin{equation*}
\int_{\mathbb{D}} \frac{\mu\left(\bar{A}_{|z|}\right)}{(1-|z|)^{2}} d \mu(z)<\infty . \tag{8}
\end{equation*}
$$

Proposition 3.5. If $\mu \geq 0$ on $\mathbb{D}$ satisfies (8), then $\mu$ is a vanishing Carleson measure on $\mathbb{D}$.

Proof. Observe that

$$
\begin{aligned}
\int_{\bar{A}_{s}} \mu\left(\bar{A}_{|z|}\right) d \mu(z) & =\int_{\bar{A}_{s}} \int_{\mathbb{D}} \chi_{\bar{A}_{|z|}}(w) d \mu(w) d \mu(z)=\int_{\mathbb{D}} \int_{\bar{A}_{s}} \chi_{\overline{\mathbb{D}}_{|w|}}(z) d \mu(z) d \mu(w) \\
& =\int_{\mathbb{D}} \mu\left(\bar{A}_{s} \cap \overline{\mathbb{D}}_{|w|}\right) d \mu(w)=\int_{\bar{A}_{s}} \mu\left(\bar{A}_{s} \cap \overline{\mathbb{D}}_{|w|}\right) d \mu(w)
\end{aligned}
$$

Hence

$$
\begin{aligned}
2 \int_{\bar{A}_{s}} \mu\left(\bar{A}_{|z|}\right) d \mu(z) & =\int_{\bar{A}_{s}} \mu\left(\bar{A}_{|z|}\right) d \mu(z)+\int_{\bar{A}_{s}} \mu\left(\bar{A}_{s} \cap \overline{\mathbb{D}}_{|z|}\right) d \mu(z) \\
& =\int_{\bar{A}_{s}} \mu\left(\bar{A}_{s}\right) d \mu(z)+\int_{\bar{A}_{s}} \mu\left(\mathbb{T}_{|z|}\right) d \mu(z)
\end{aligned}
$$

TOEPLITZ AND HANKEL OPERATORS WITH CARLESON MEASURE SYMBOLS 101

$$
=\mu\left(\bar{A}_{s}\right)^{2}+\int_{\bar{A}_{s}} \mu\left(\mathbb{T}_{|z|}\right) d \mu(z)
$$

In particular,

$$
\begin{equation*}
\mu\left(\bar{A}_{s}\right)^{2} \leq 2 \int_{\bar{A}_{s}} \mu\left(\bar{A}_{|z|}\right) d \mu(z) \tag{9}
\end{equation*}
$$

Let $\epsilon>0$. Then there exists $s_{0}>0$ such that $s \geq s_{0}$ implies

$$
\int_{\bar{A}_{s}} \frac{\mu\left(\bar{A}_{|z|}\right)}{(1-|z|)^{2}} d \mu(z)<\epsilon
$$

It follows from (9) that

$$
\begin{aligned}
2 \epsilon & >2 \int_{\bar{A}_{s}} \frac{\mu\left(\bar{A}_{|z|}\right)}{(1-|z|)^{2}} d \mu(z) \\
& \geq \frac{2}{(1-s)^{2}} \int_{\bar{A}_{s}} \mu\left(\bar{A}_{|z|}\right) d \mu(z) \geq \frac{\mu\left(\bar{A}_{s}\right)^{2}}{(1-s)^{2}} \geq \frac{\mu\left(S_{\theta, 1-s}\right)^{2}}{(1-s)^{2}}
\end{aligned}
$$

for every $\theta$. This shows that $\mu$ is a vanishing Carleson measure.
Theorem 3.6. If a positive measure $\mu$ on $\mathbb{D}$ satisfies (8), then $H(\mu) \in S_{2}$.
Proof. Suppose that $\mu$ satisfies the above condition. Since

$$
\begin{aligned}
\|H(\mu)\|_{S^{2}} & =\sum_{i, j=0}^{\infty}|\hat{\mu}(i+j)|^{2} \\
& \leq \sum_{i, j=0}^{\infty} \int_{\mathbb{D}} \int_{\mathbb{D}}(|z \| w|)^{i+j} d \mu(z) d \mu(w)=\int_{\mathbb{D}} \int_{\mathbb{D}} \frac{d \mu(z) d \mu(w)}{(1-|z||w|)^{2}}
\end{aligned}
$$

it suffices to show that the last integral is finite. Observe that for any positive measurable function $f(z, w)$, we have

$$
\begin{aligned}
\int_{\mathbb{D}} \int_{\mathbb{D}_{|z|}} f(z, w) d \mu(w) d \mu(z) & =\int_{\mathbb{D}} \int_{\mathbb{D}} f(z, w) \chi_{\mathbb{D}_{|z|}}(w) d \mu(w) d \mu(z) \\
& =\int_{\mathbb{D}} \int_{\mathbb{D}} f(z, w) \chi_{A_{|w|}}(z) d \mu(z) d \mu(w) \\
& =\int_{\mathbb{D}} \int_{A_{|w|}} f(z, w) d \mu(z) d \mu(w)
\end{aligned}
$$

Hence

$$
\begin{aligned}
\int_{\mathbb{D}} \int_{\mathbb{D}} \frac{d \mu(z) d \mu(w)}{(1-|z||w|)^{2}} & =\int_{\mathbb{D}} \int_{A_{|z|}} \frac{d \mu(z) d \mu(w)}{(1-|z||w|)^{2}}+\int_{\mathbb{D}} \int_{\bar{A}_{|z|}} \frac{d \mu(z) d \mu(w)}{(1-|z||w|)^{2}} \\
& \leq \int_{\mathbb{D}} \frac{A_{|z|}}{(1-|z|)^{2}} d \mu(z)+\int_{\mathbb{D}} \frac{\mu\left(\bar{A}_{|z|}\right)}{(1-|z|)^{2}} d \mu(z) \\
& \leq 2 \cdot \int_{\mathbb{D}} \frac{\mu\left(\bar{A}_{|z|}\right)}{(1-|z|)^{2}} d \mu(z)<\infty
\end{aligned}
$$

Note that the converse is not true: If $m_{2}$ is a Lebesgue measure on $\mathbb{D}$, then $H\left(m_{2}\right)$ is of finite rank, but

$$
\int_{\mathbb{D}} \frac{\mu\left(\bar{A}_{|z|}\right)}{\left(1-|z|^{2}\right)} d m_{2}(z)=\int_{0}^{2 \pi} \int_{0}^{1} \frac{\pi\left(1-r^{2}\right)}{(1-r)^{2}} r d r d \theta=\infty
$$
